

## oneskirt..R,Z\_plot; long propellant tank with one skirt support

(inches) Axial Station  $\times 10^{-2}$

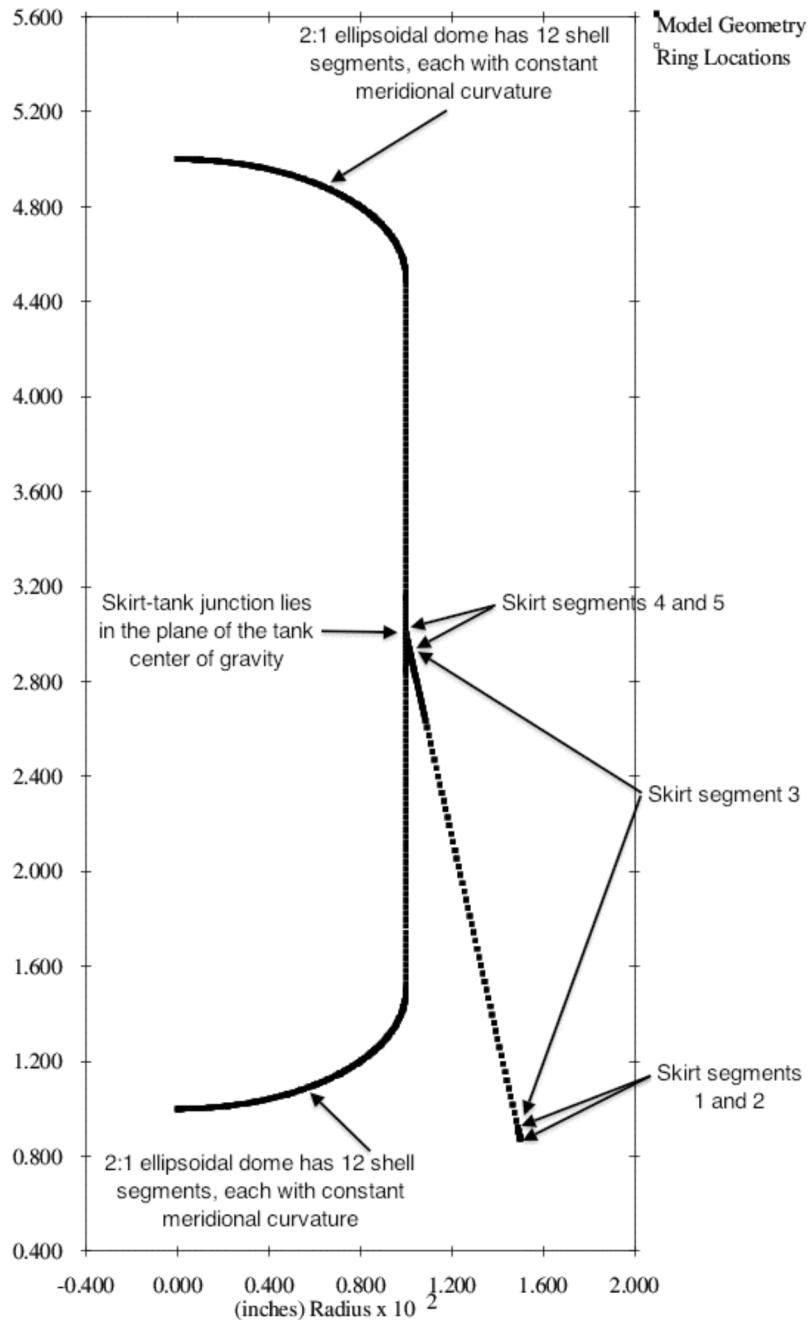

Fig. 1 Optimized discretized tank/skirt system obtained with the use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). Predictions from this optimized configuration should be compared with predictions from STAGS. The configuration and GENOPT/BIGBOSOR4 predictions are listed in Table 6. The bottom end of the skirt is simply supported to “ground” (the rigid launch vehicle).

□ WGTxTOTMAS/TNKNRM +(1-WGT)xCONDCT/CONNRM: CONDCT

### GENOPT oneskirt: objective vs design iterations

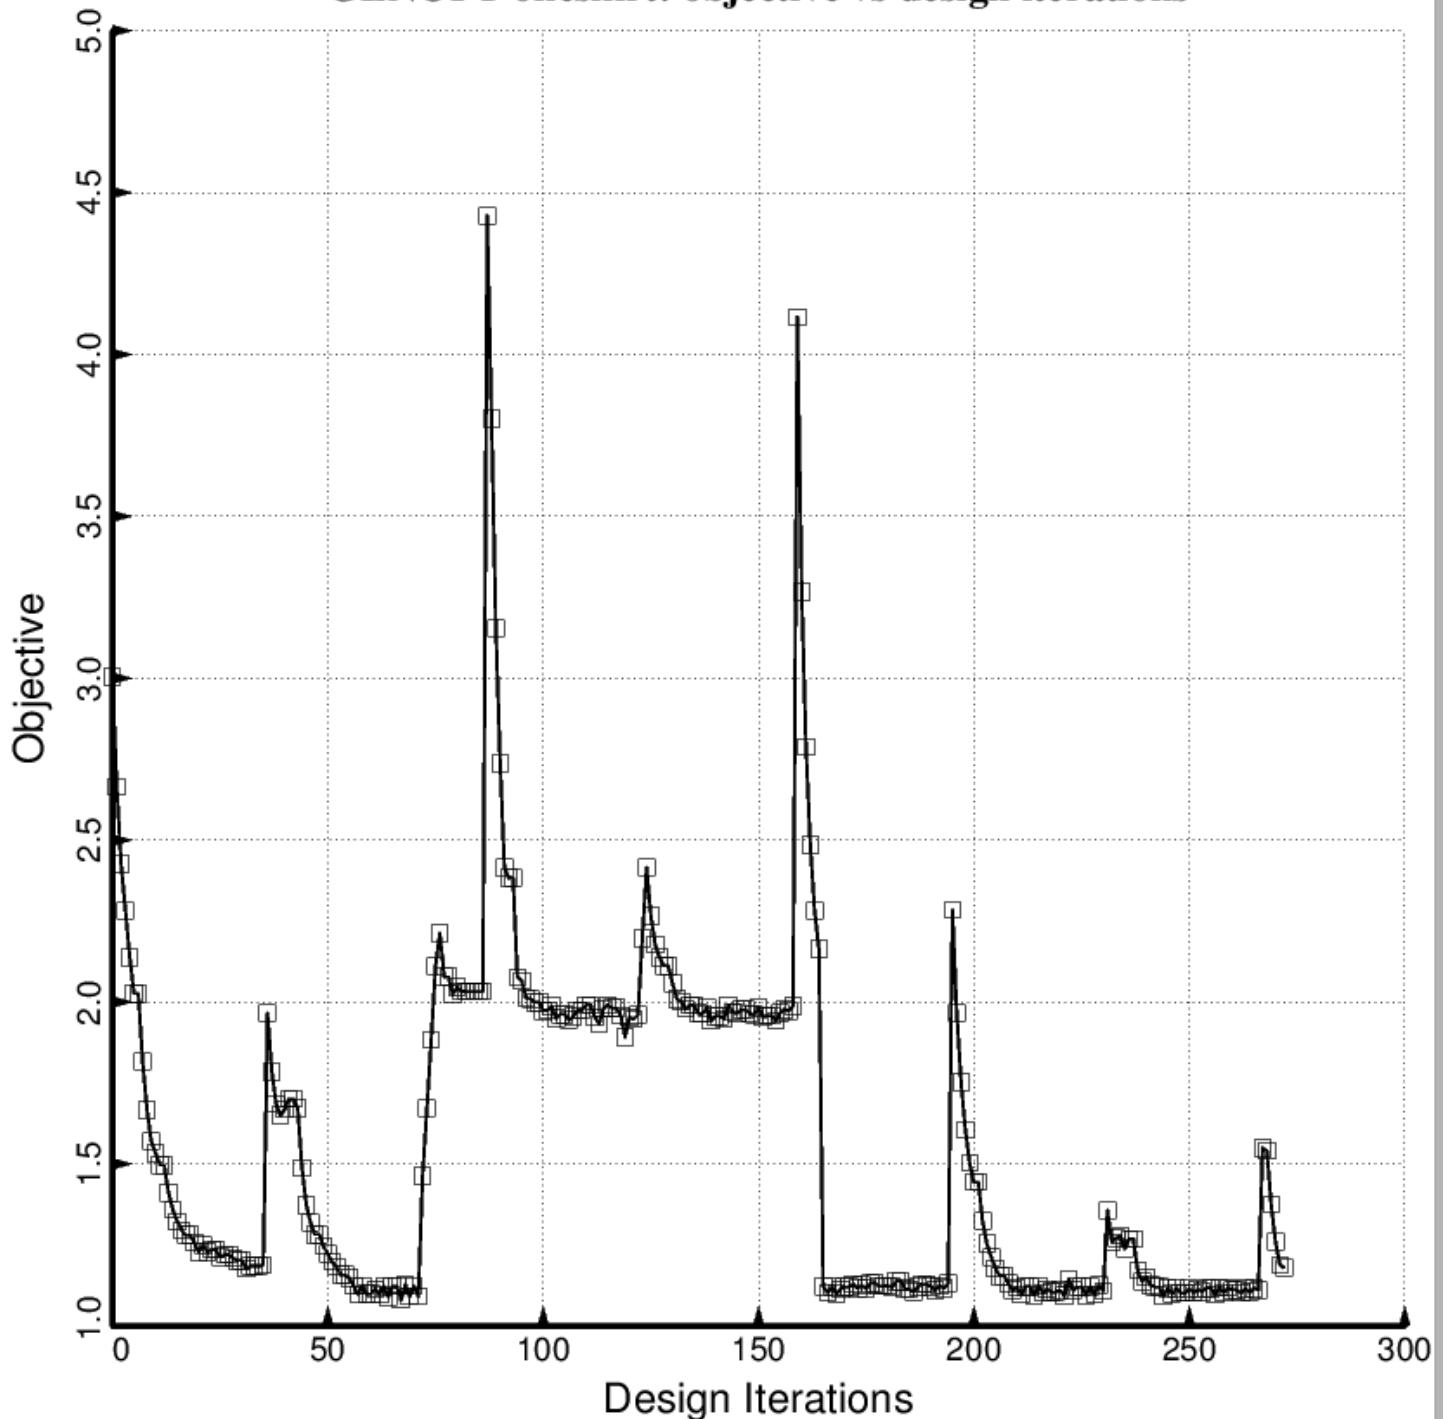

Fig. 2a (new) Evolution of the objective during a partial execution of SUPEROPT for the specific case, “oneskirt” obtained with the use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The decision variables are listed in Table 4.

□ WGTxTCTMAS/TNKNRM +(1-WGT)xCONDCT/CONNRM: CONDCT

### oneskirt: objective vs design iterations (varying density)

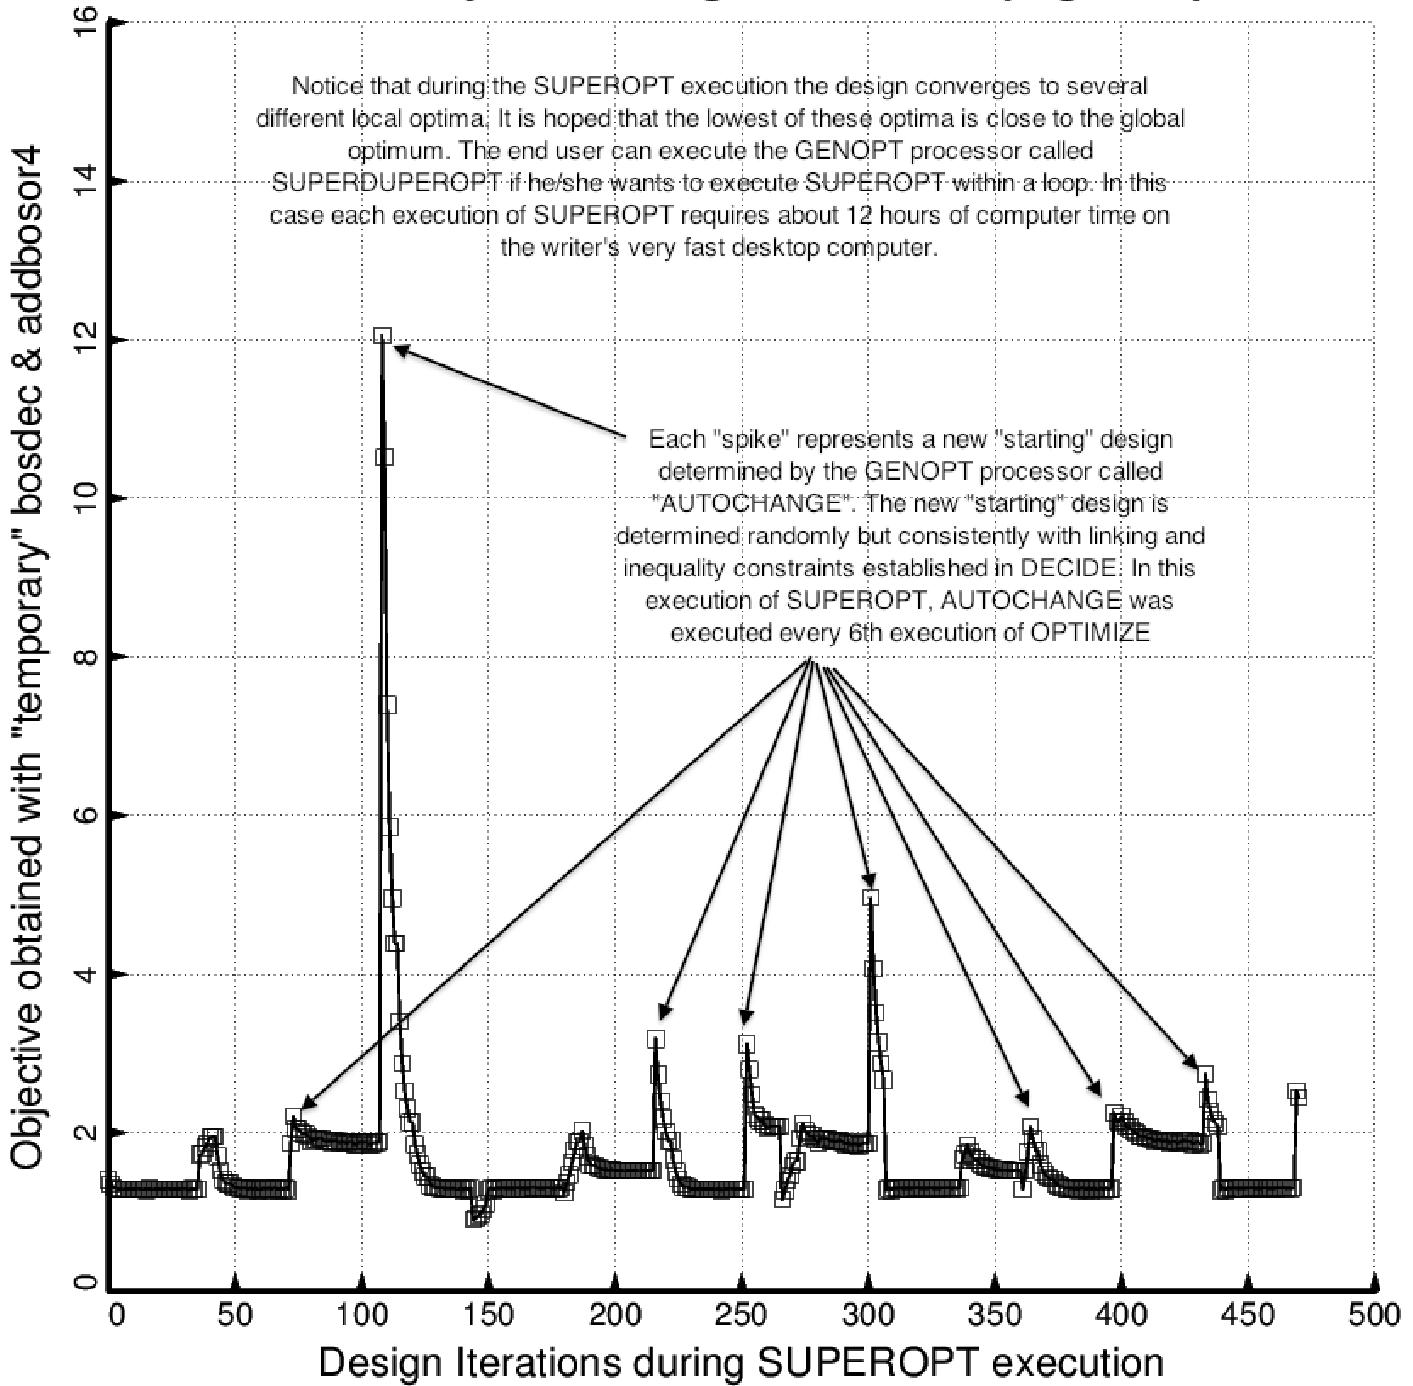

Fig. 2a (old) Evolution of the objective during an execution of SUPEROPT for the specific case, "oneskirt" obtained with the use of the "temporary" versions of bosdec and addbosor4. The decision variables are listed in Table 4.

□ WGTxTOTMAS/TNKNRM +(1-WGT)xCONDCT/CONNRM: CONDCT

### GENOPT oneskirt: objective vs design iterations

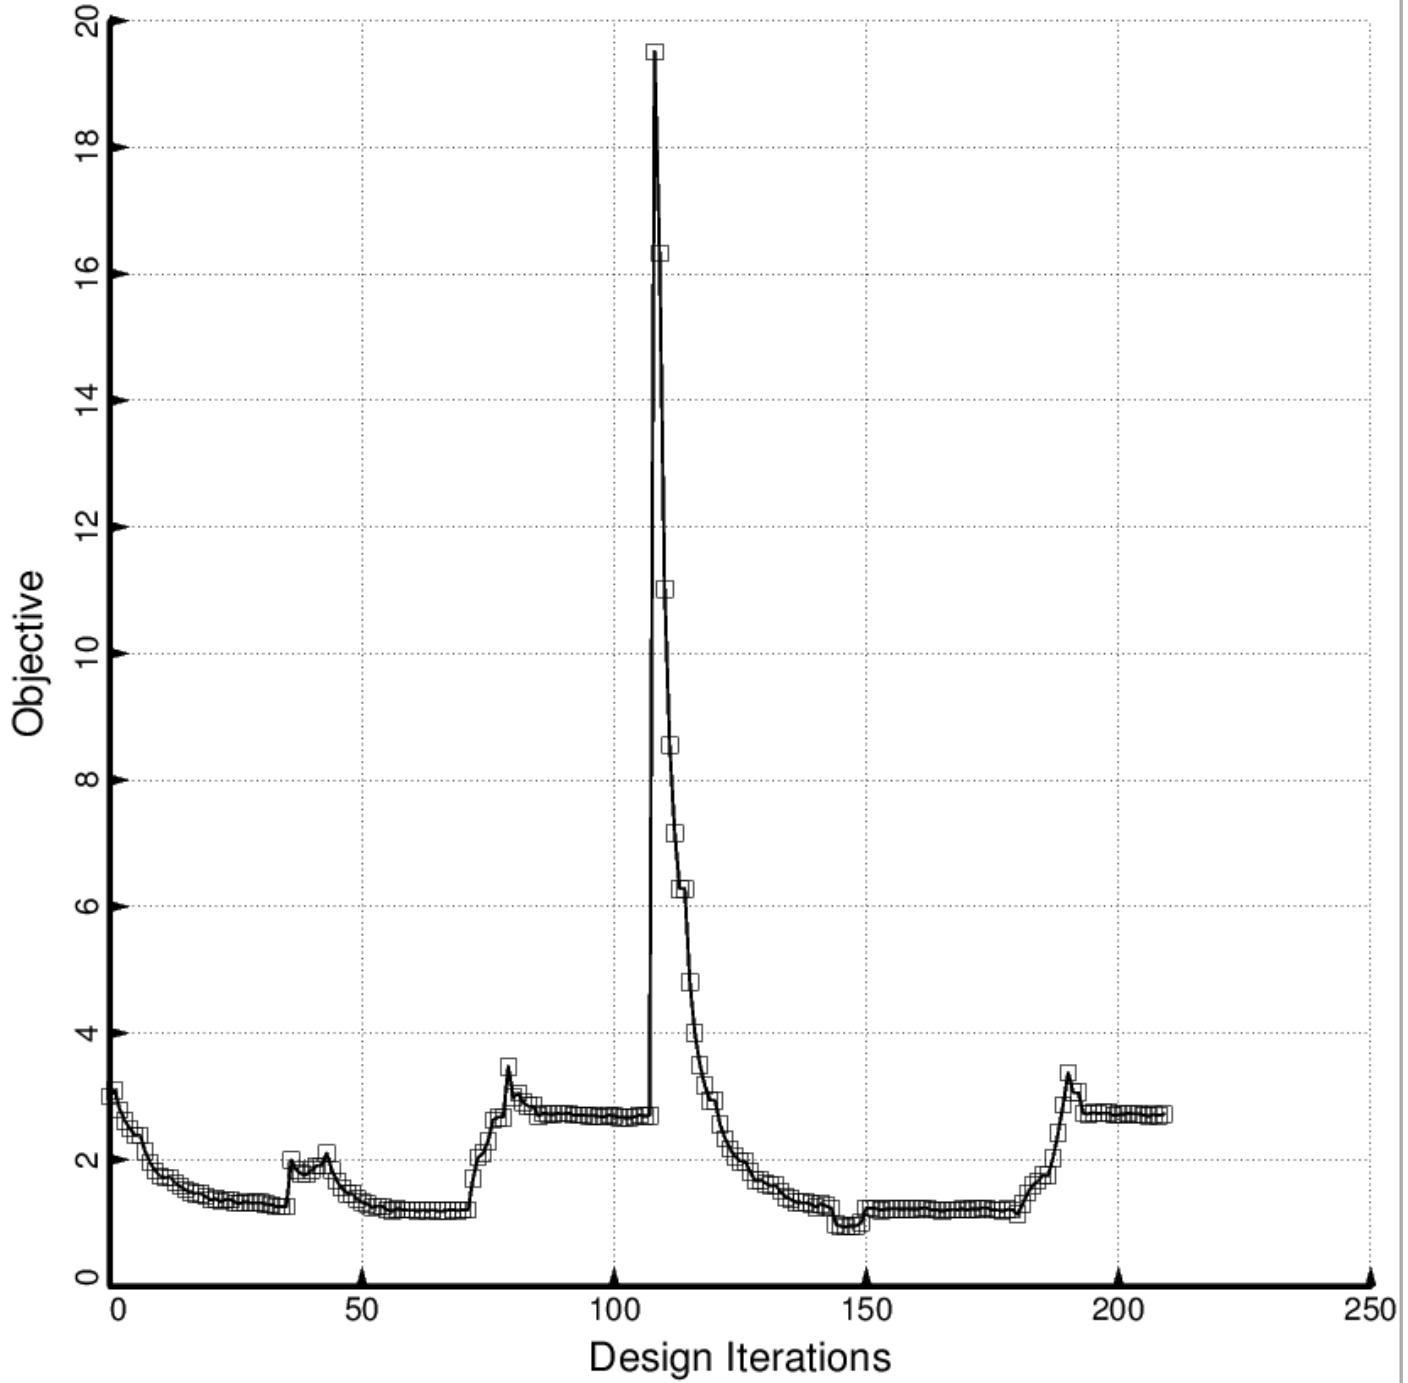

Fig. 2b (new) Evolution of the objective during a partial execution of SUPEROPT for the specific case, “oneskirt” obtained with the use of the “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular). The decision variables are listed in Table 4.

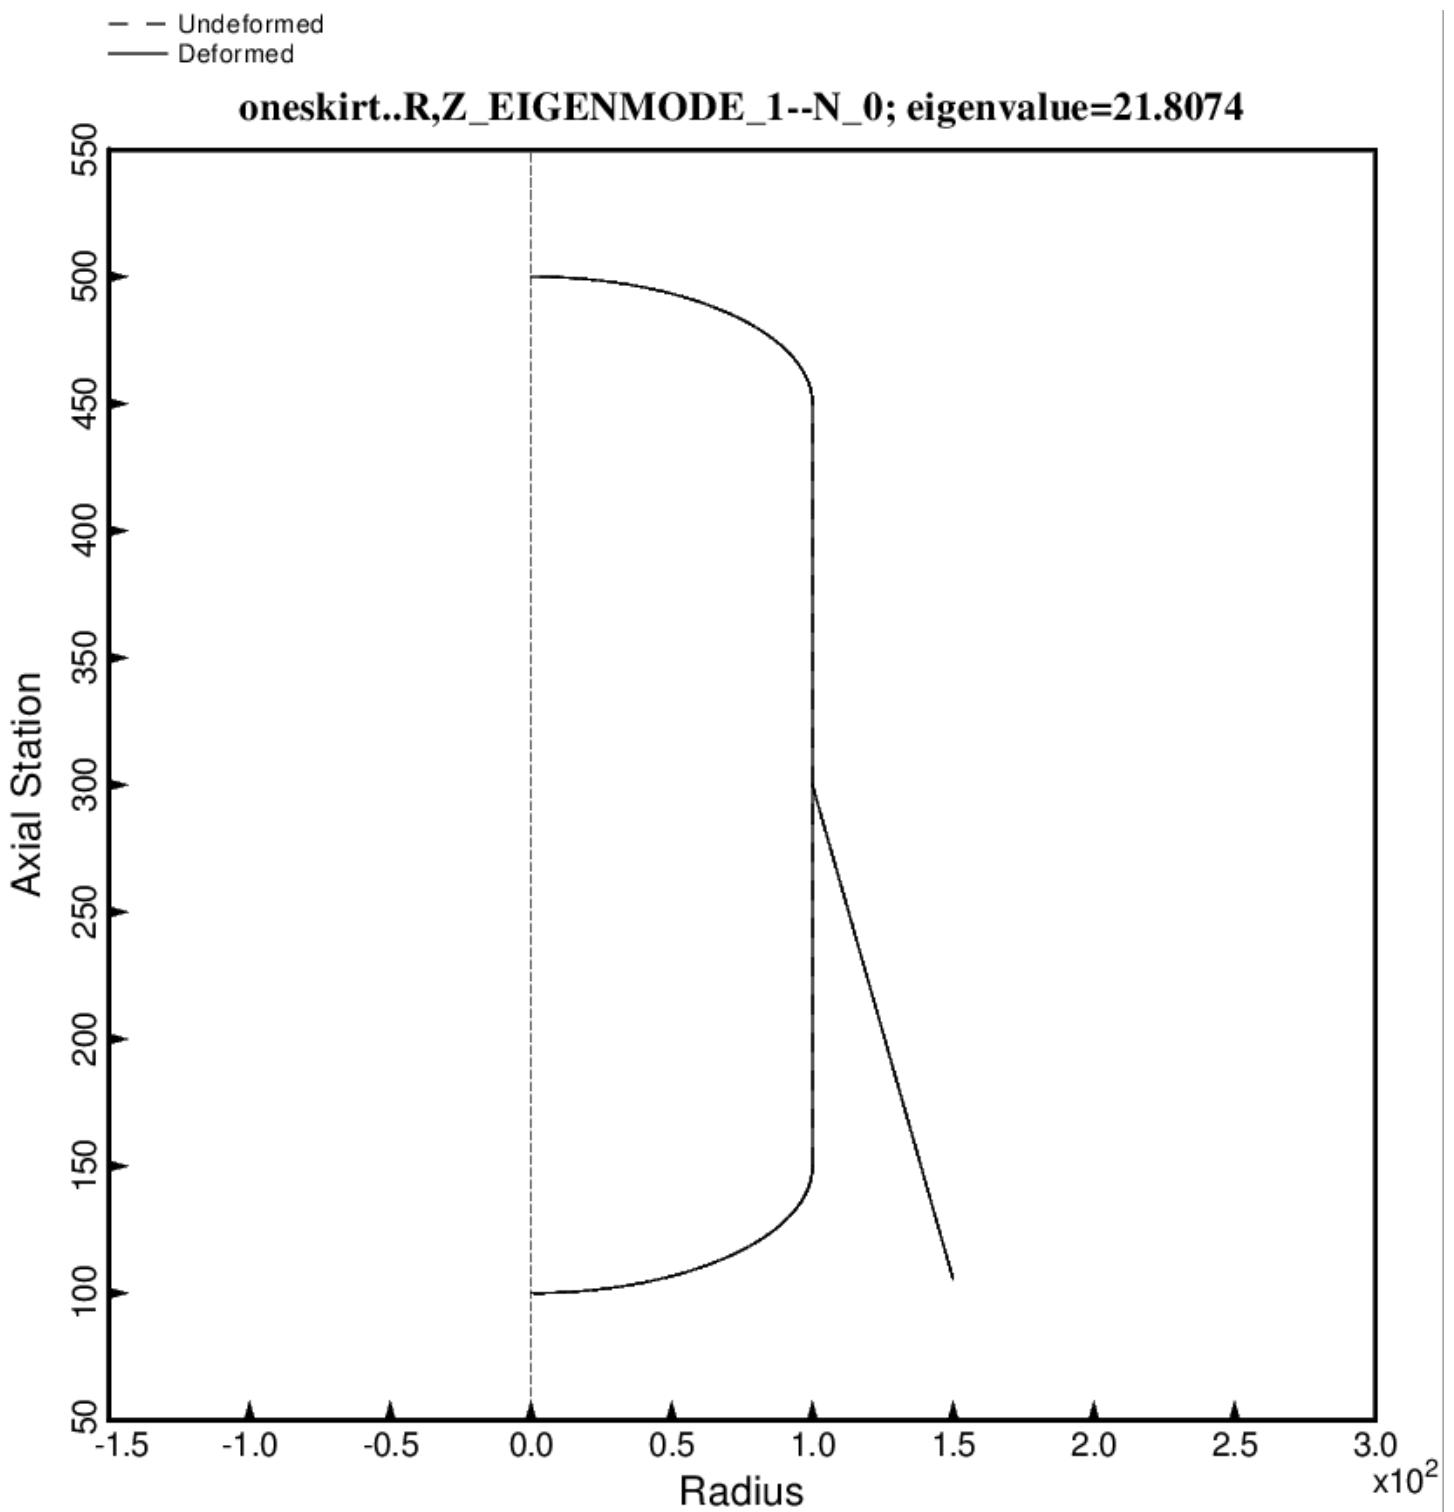

Fig. 3 (new) Rolling vibration mode for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

—— Undeformed  
 — Deformed

### oneskirt: vibration mode 1, n=0 circ.waves; eigenvalue=20.5691 cps

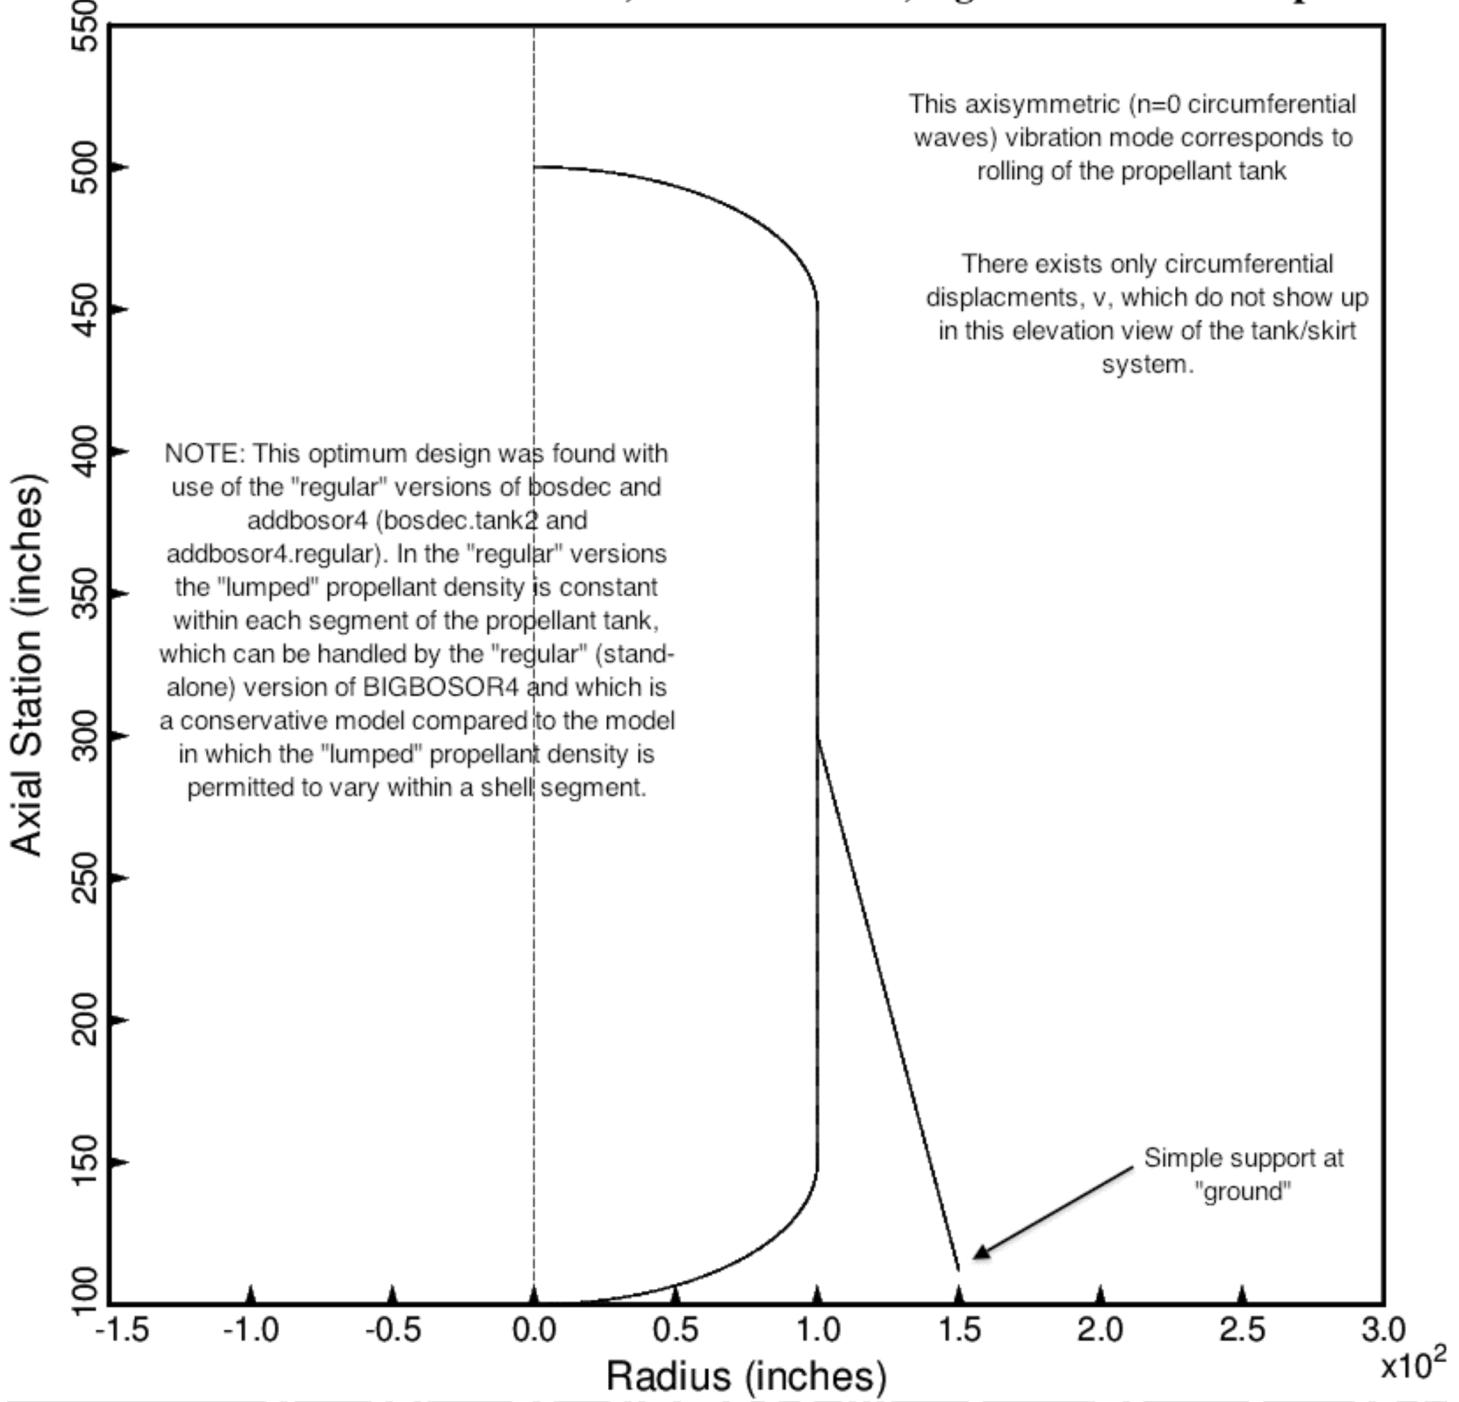

Fig. 3 (old) Rolling vibration mode for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

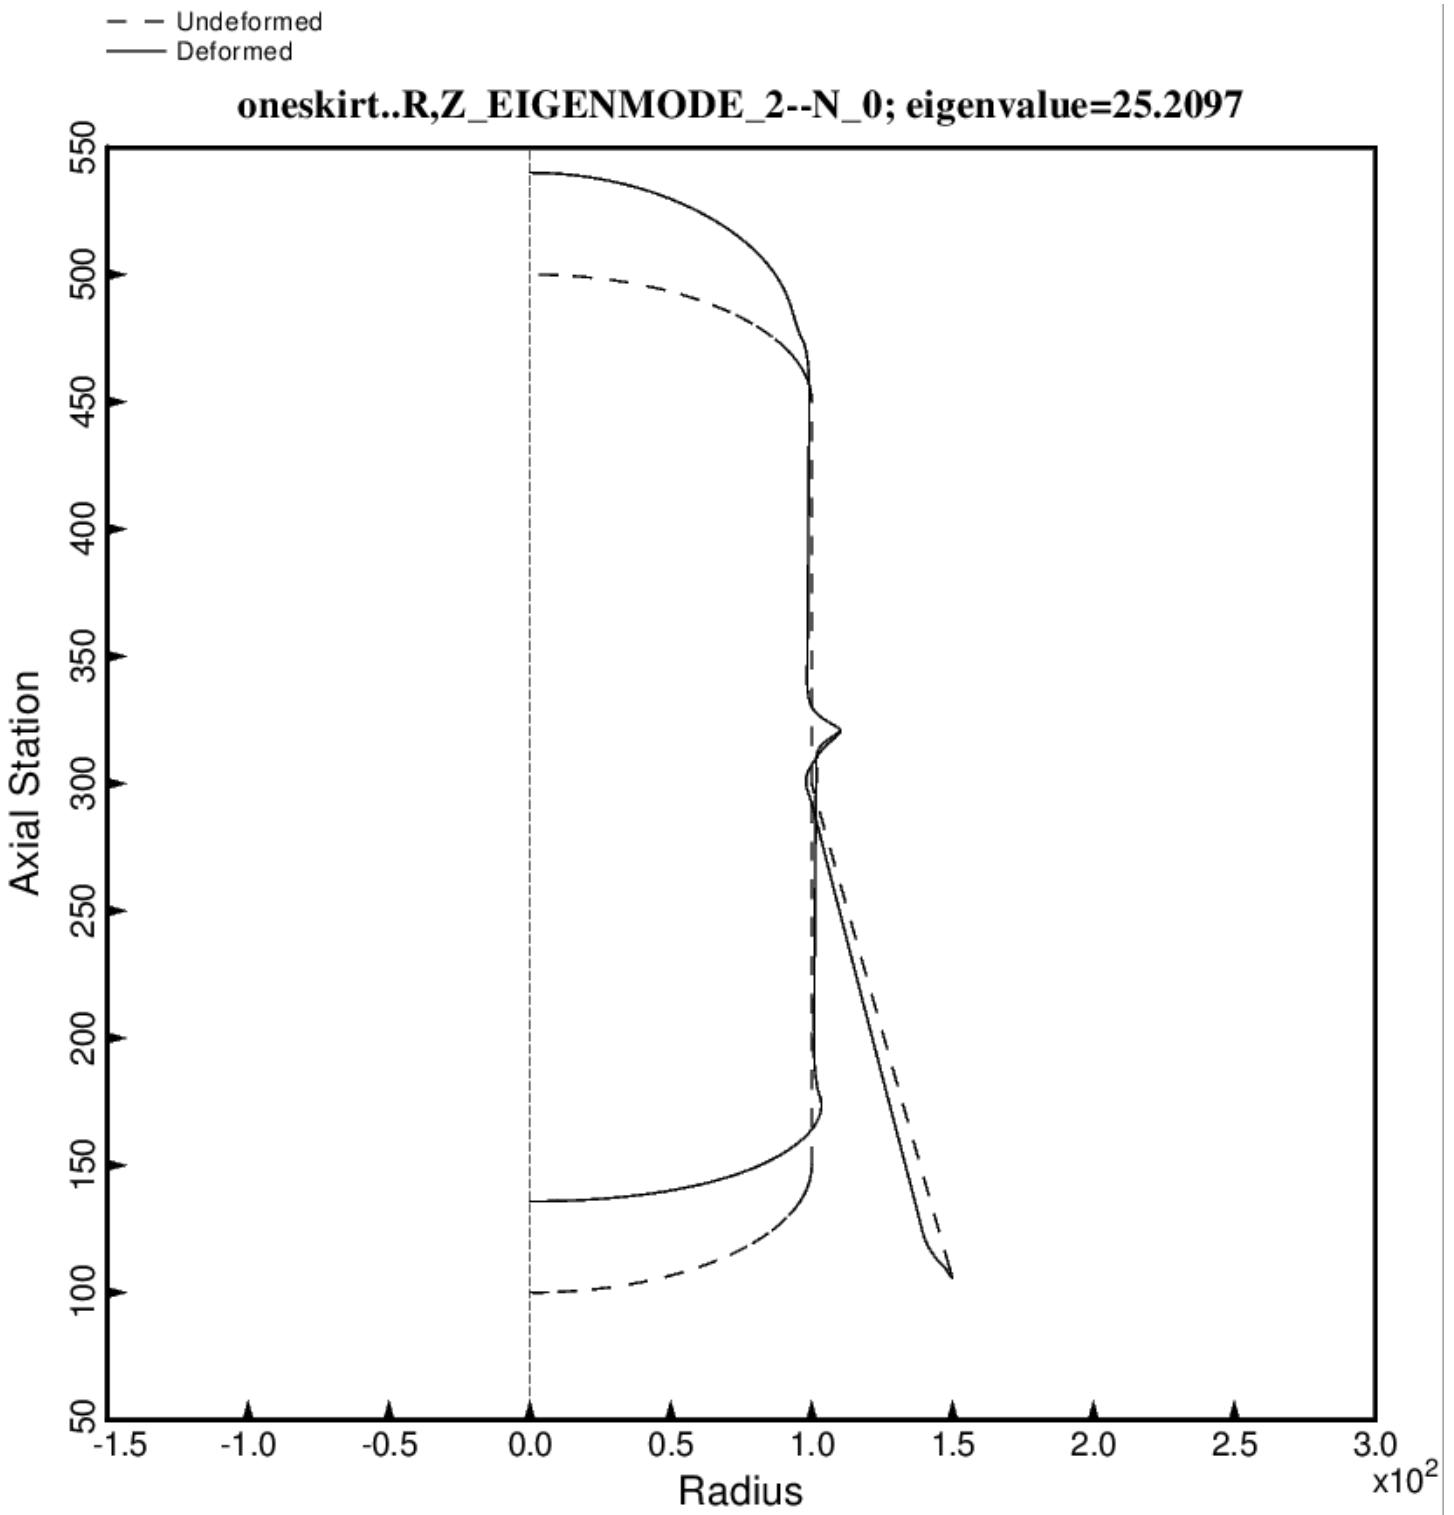

Fig. 4 (new) Axisymmetric axial vibration mode for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

—— Undeformed  
 - - - Deformed

### oneskirt: vibration mode 2; n=0 circ.waves; eigenvalue=26.449 cps

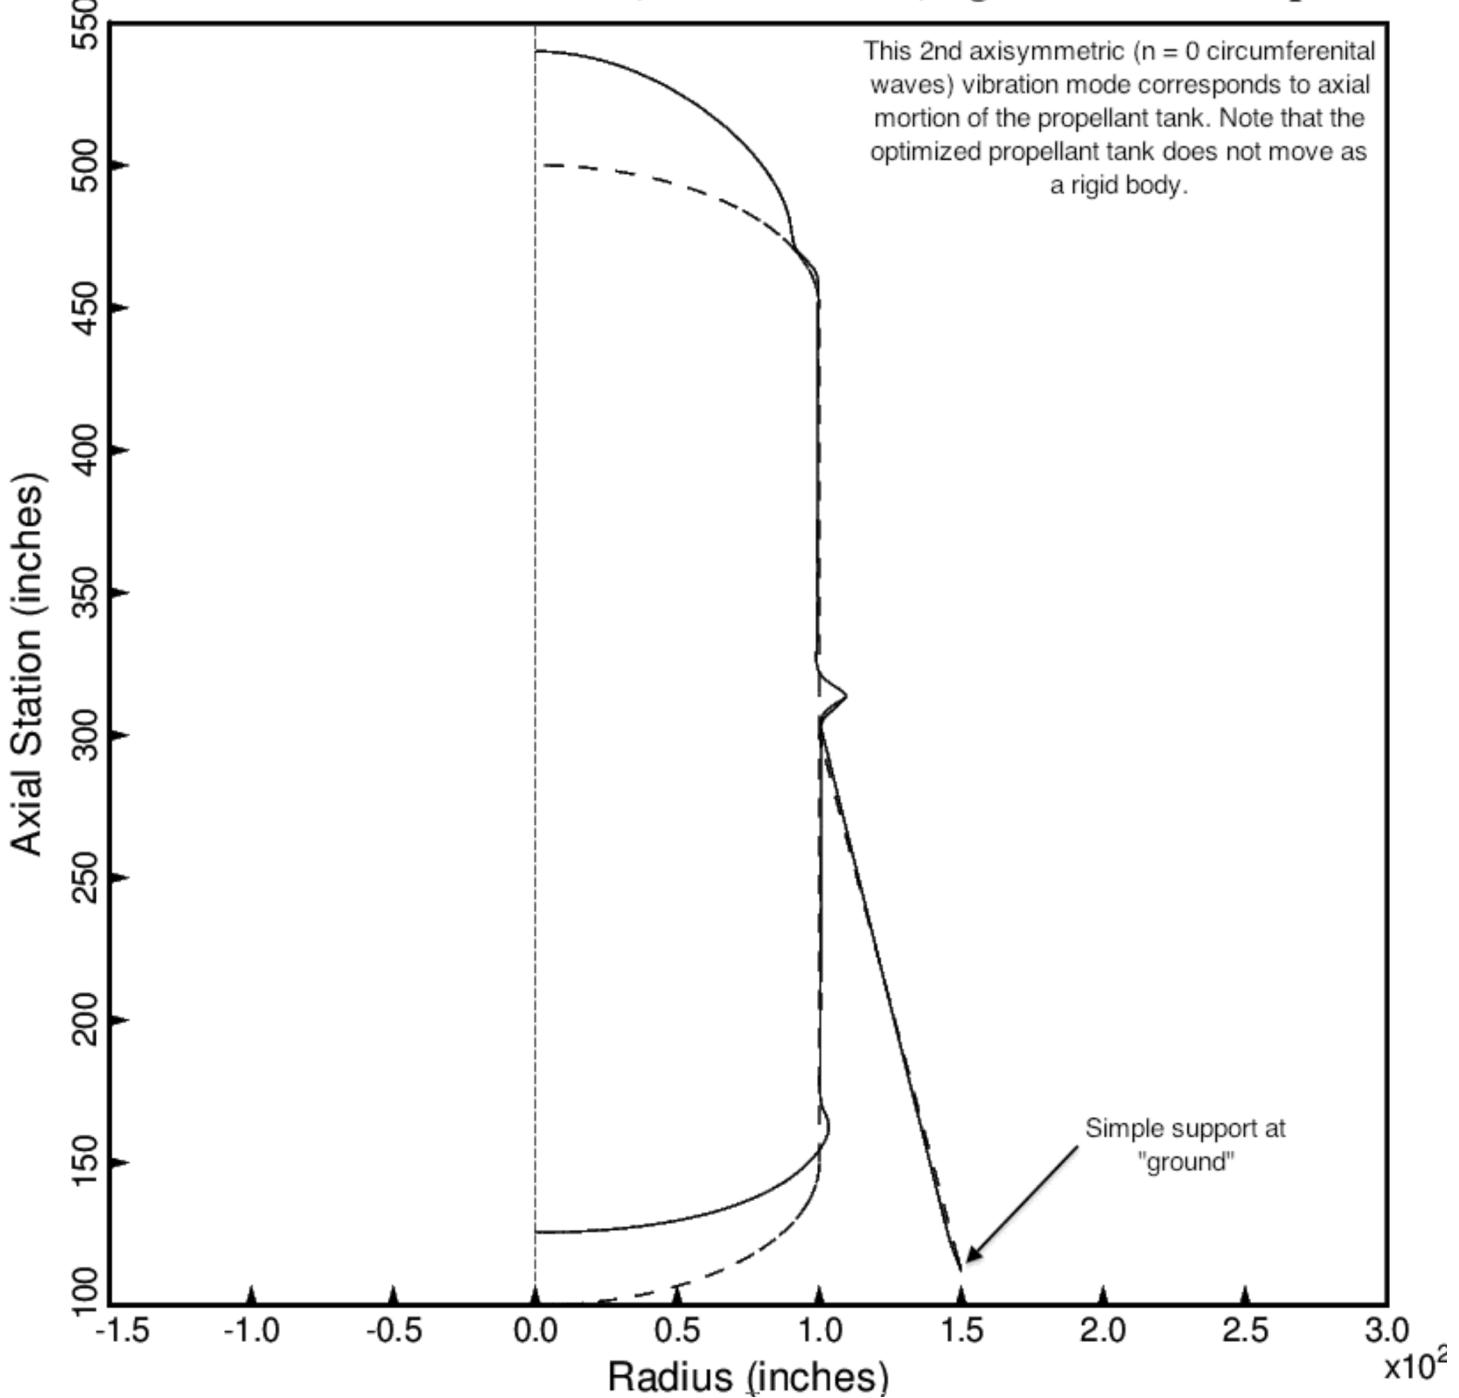

Fig. 4 (old) Axisymmetric axial vibration mode for the optimized tank/skirt system determined with use of the "regular" or "permanent" versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

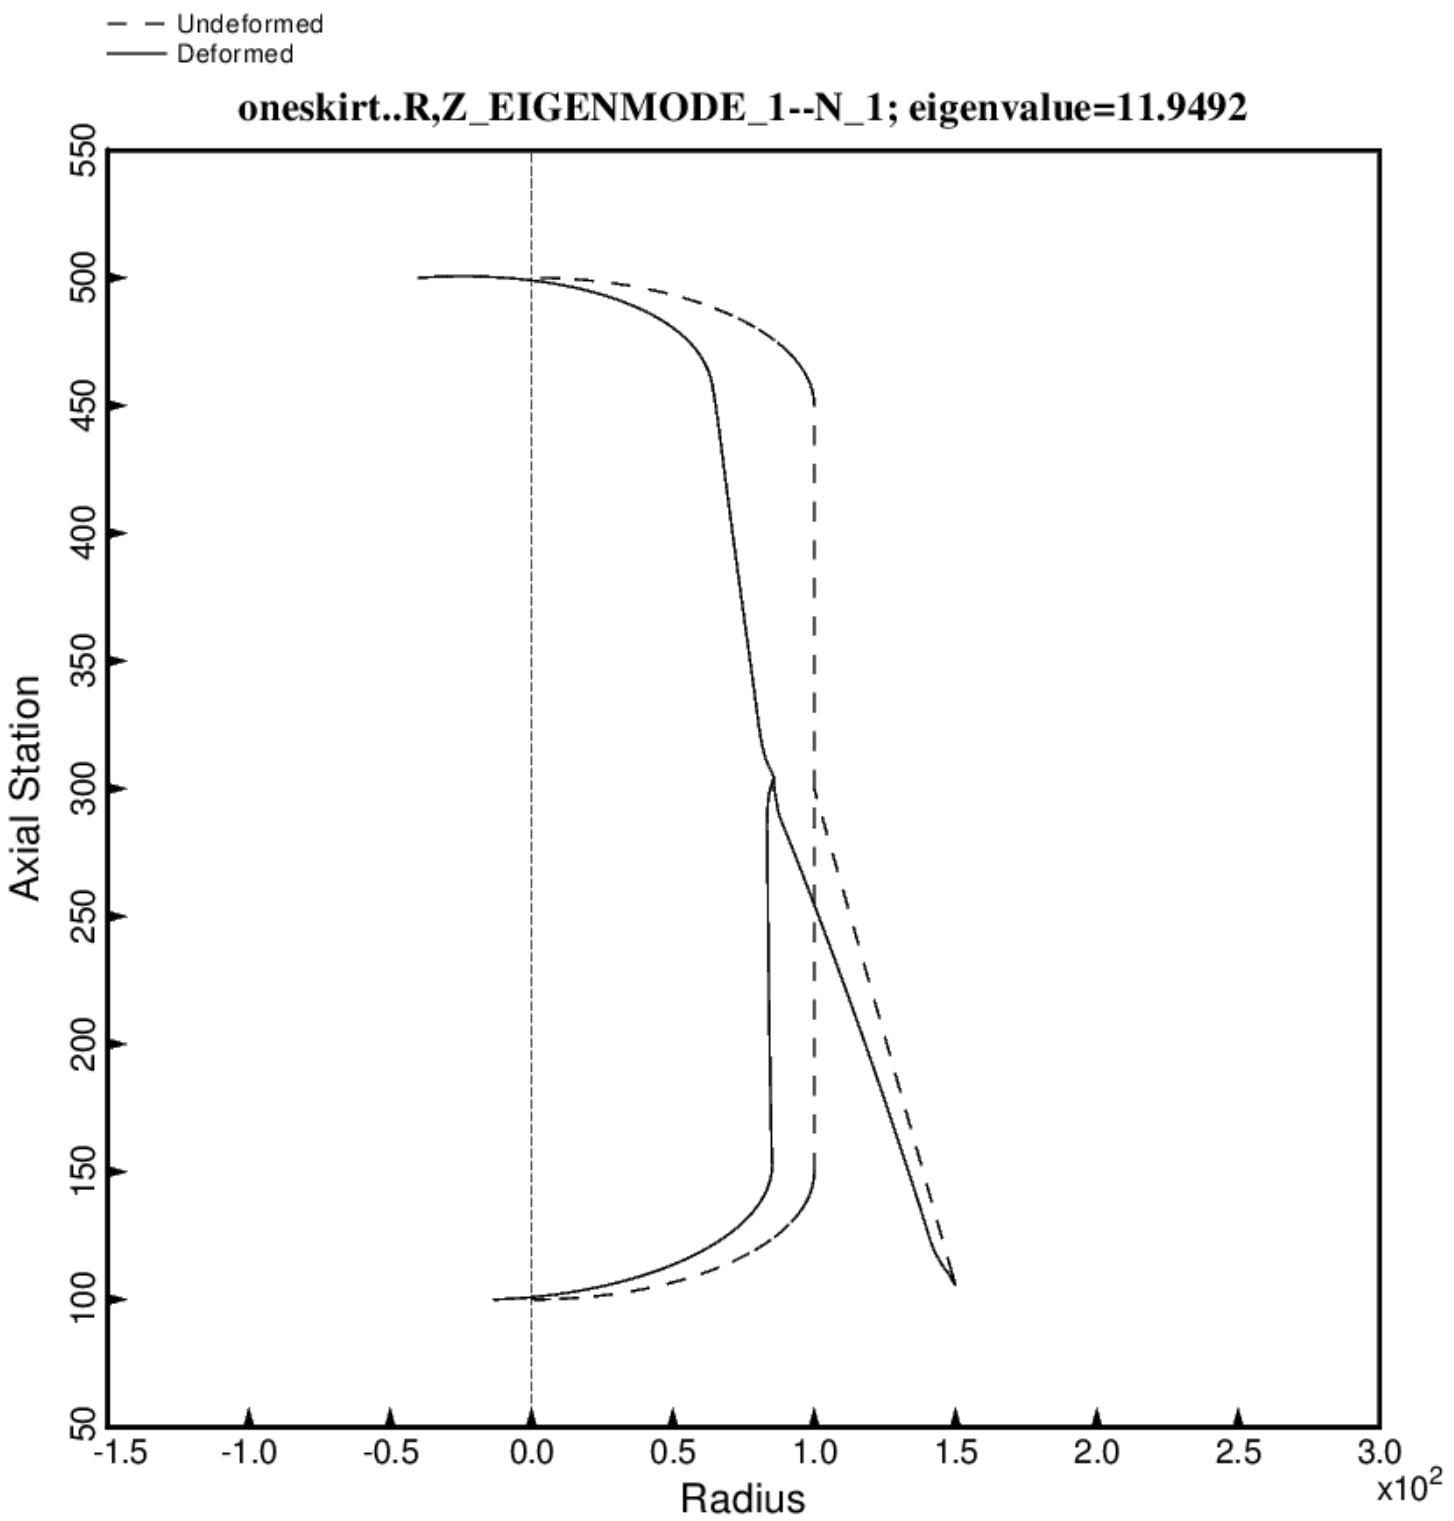

Fig. 5 (new) Lateral-pitching vibration mode No. 1 for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

- - - Undeformed  
 — Deformed

**oneskirt: vibration mode 1; n=1 circ.wave; eigenvalue=11.881 cps**

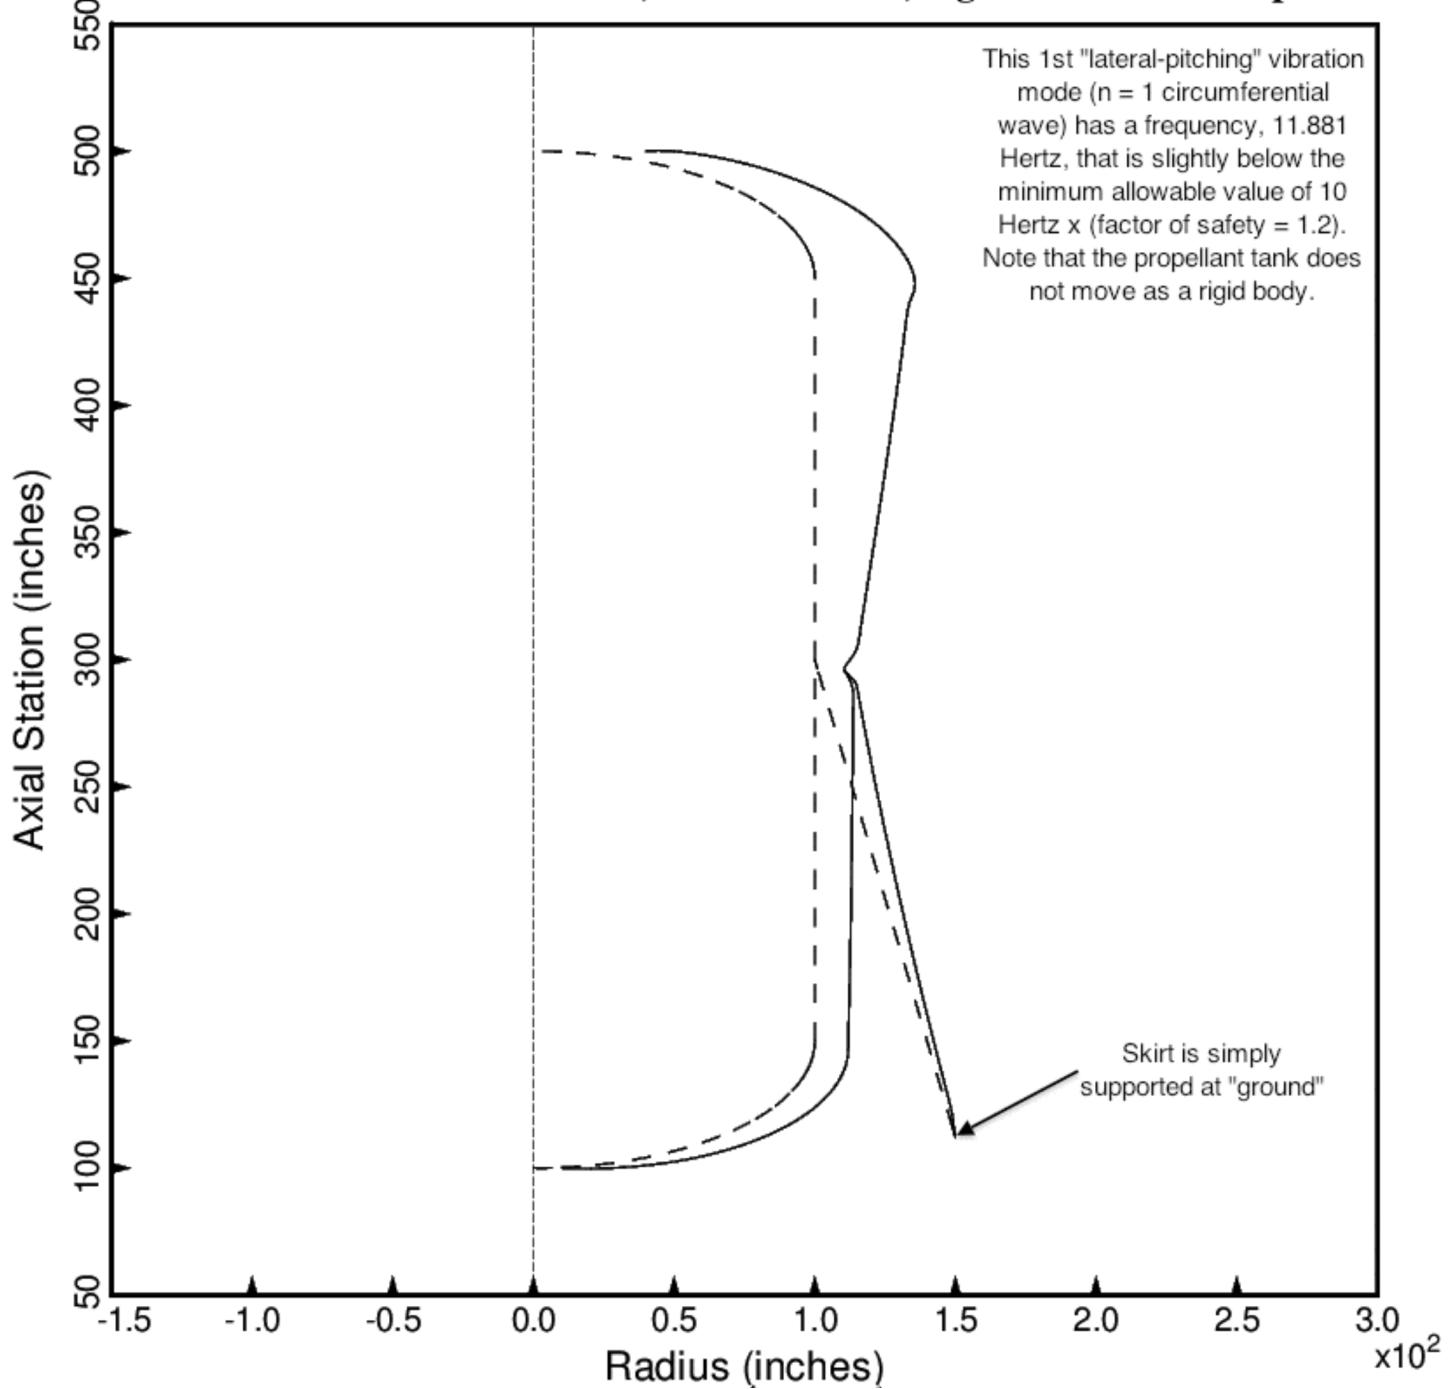

Fig. 5 (old) Lateral-pitching vibration mode No. 1 for the optimized tank/skirt system determined with use of the "regular" or "permanent" versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

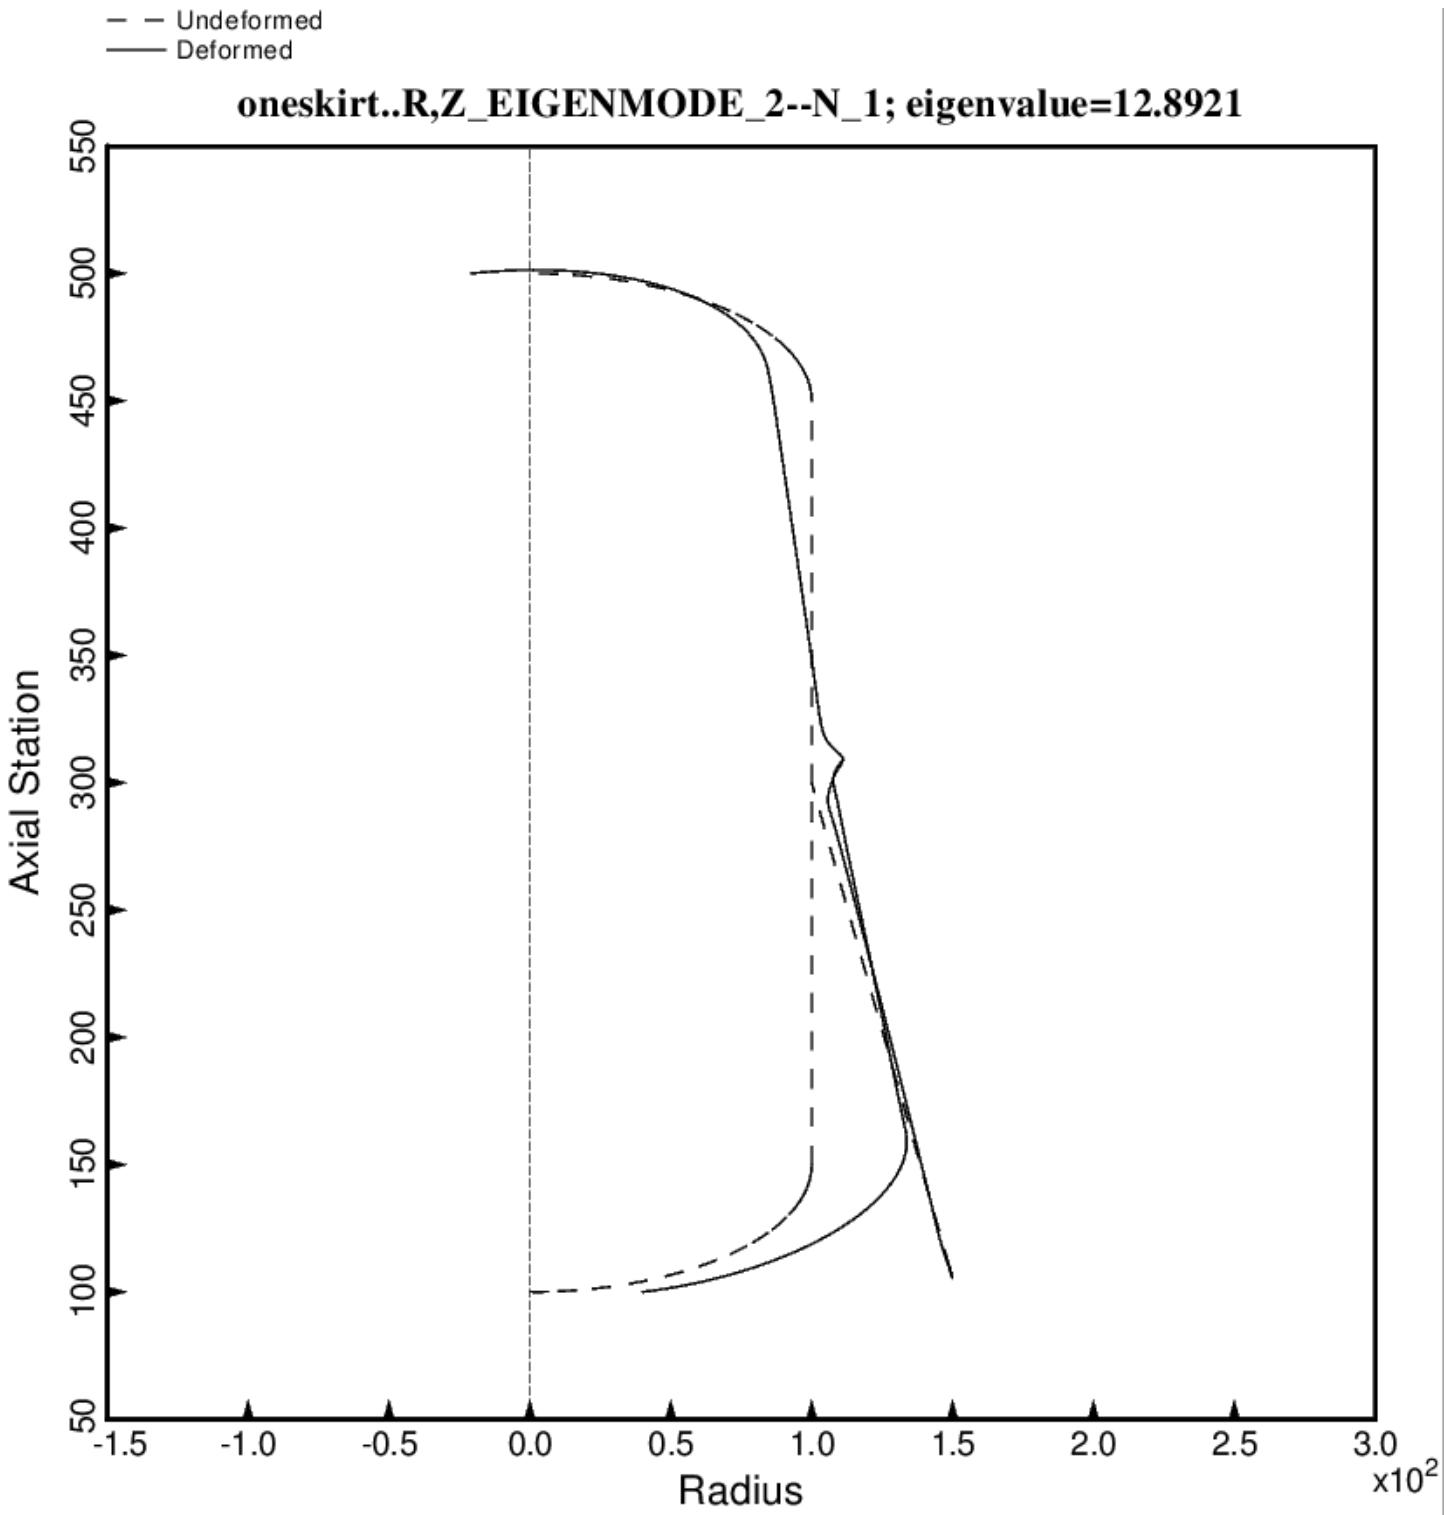

Fig. 6 (new) Lateral-pitching vibration mode No. 2 for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

—— Undeformed  
 — Deformed

**oneskirt: vibration mode 2; n=1 circ.wave; eigenvalue=13.829 cps**

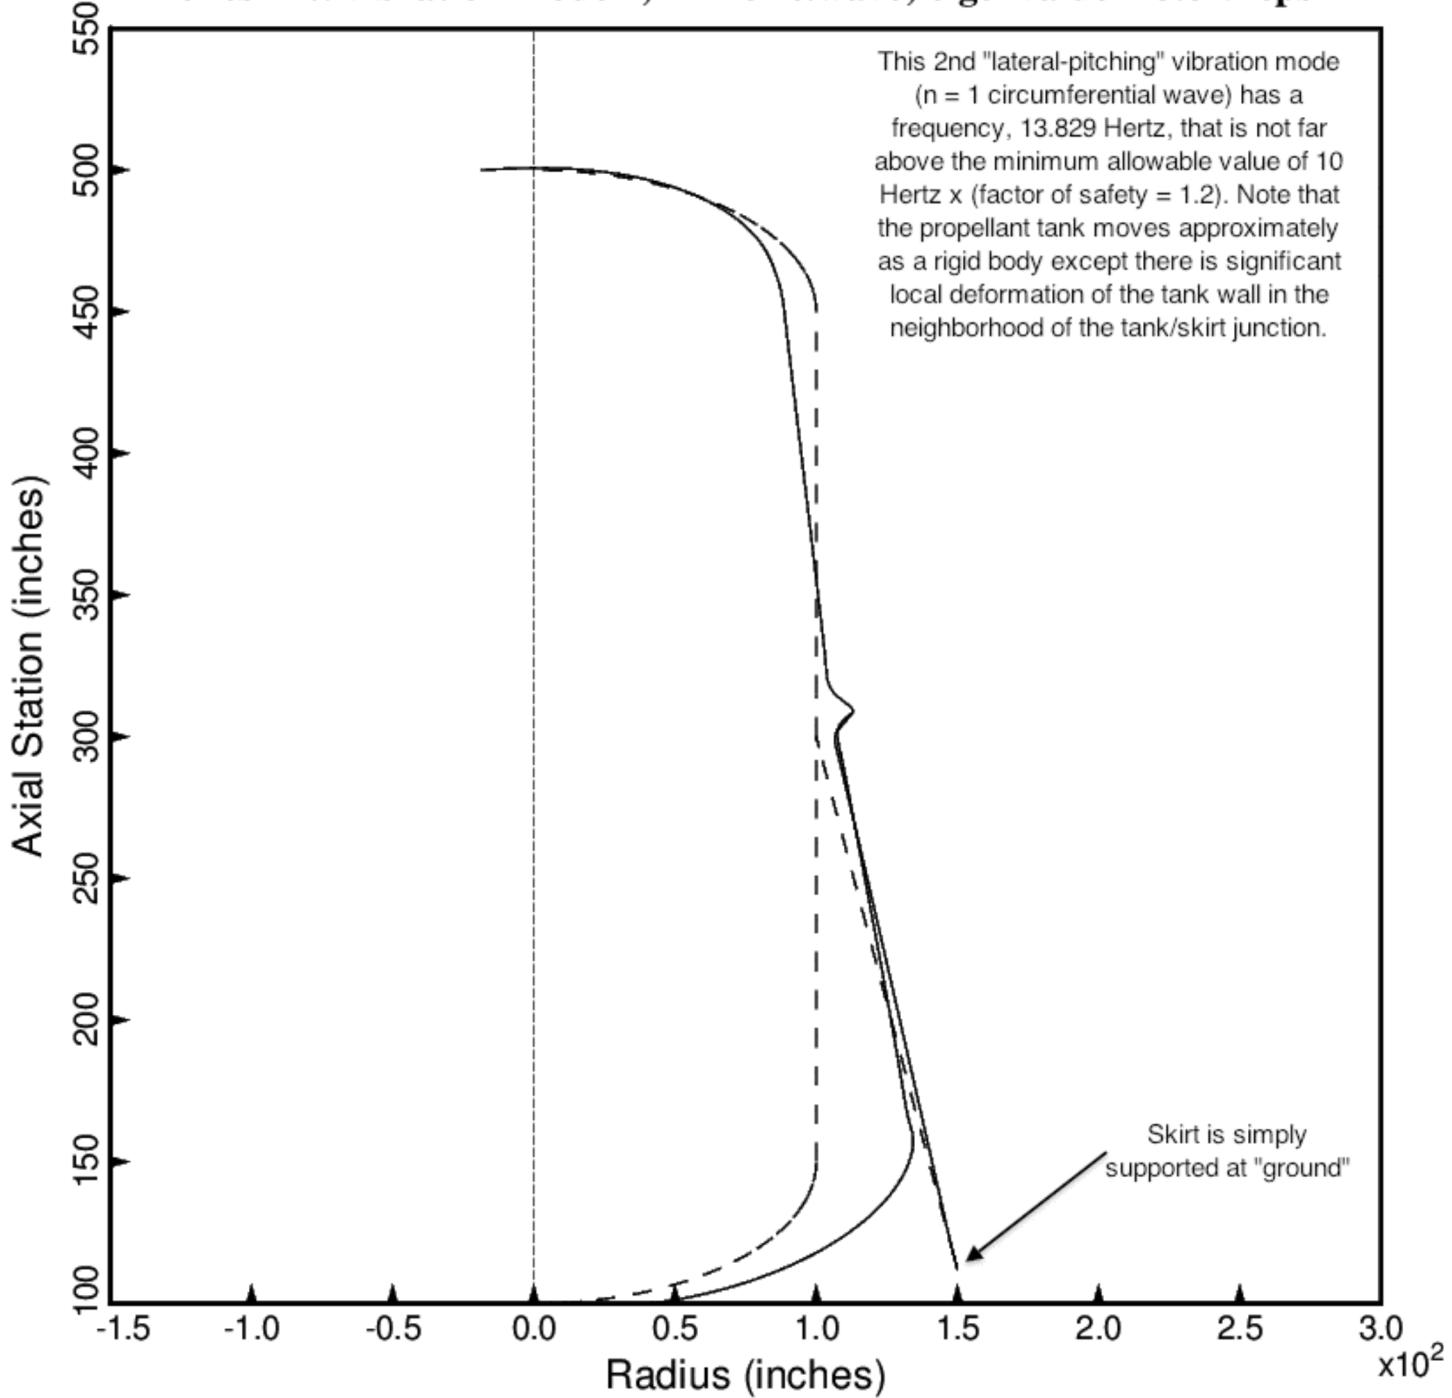

Fig. 6 (old) Lateral-pitching vibration mode No. 2 for the optimized tank/skirt system determined with use of the "regular" or "permanent" versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

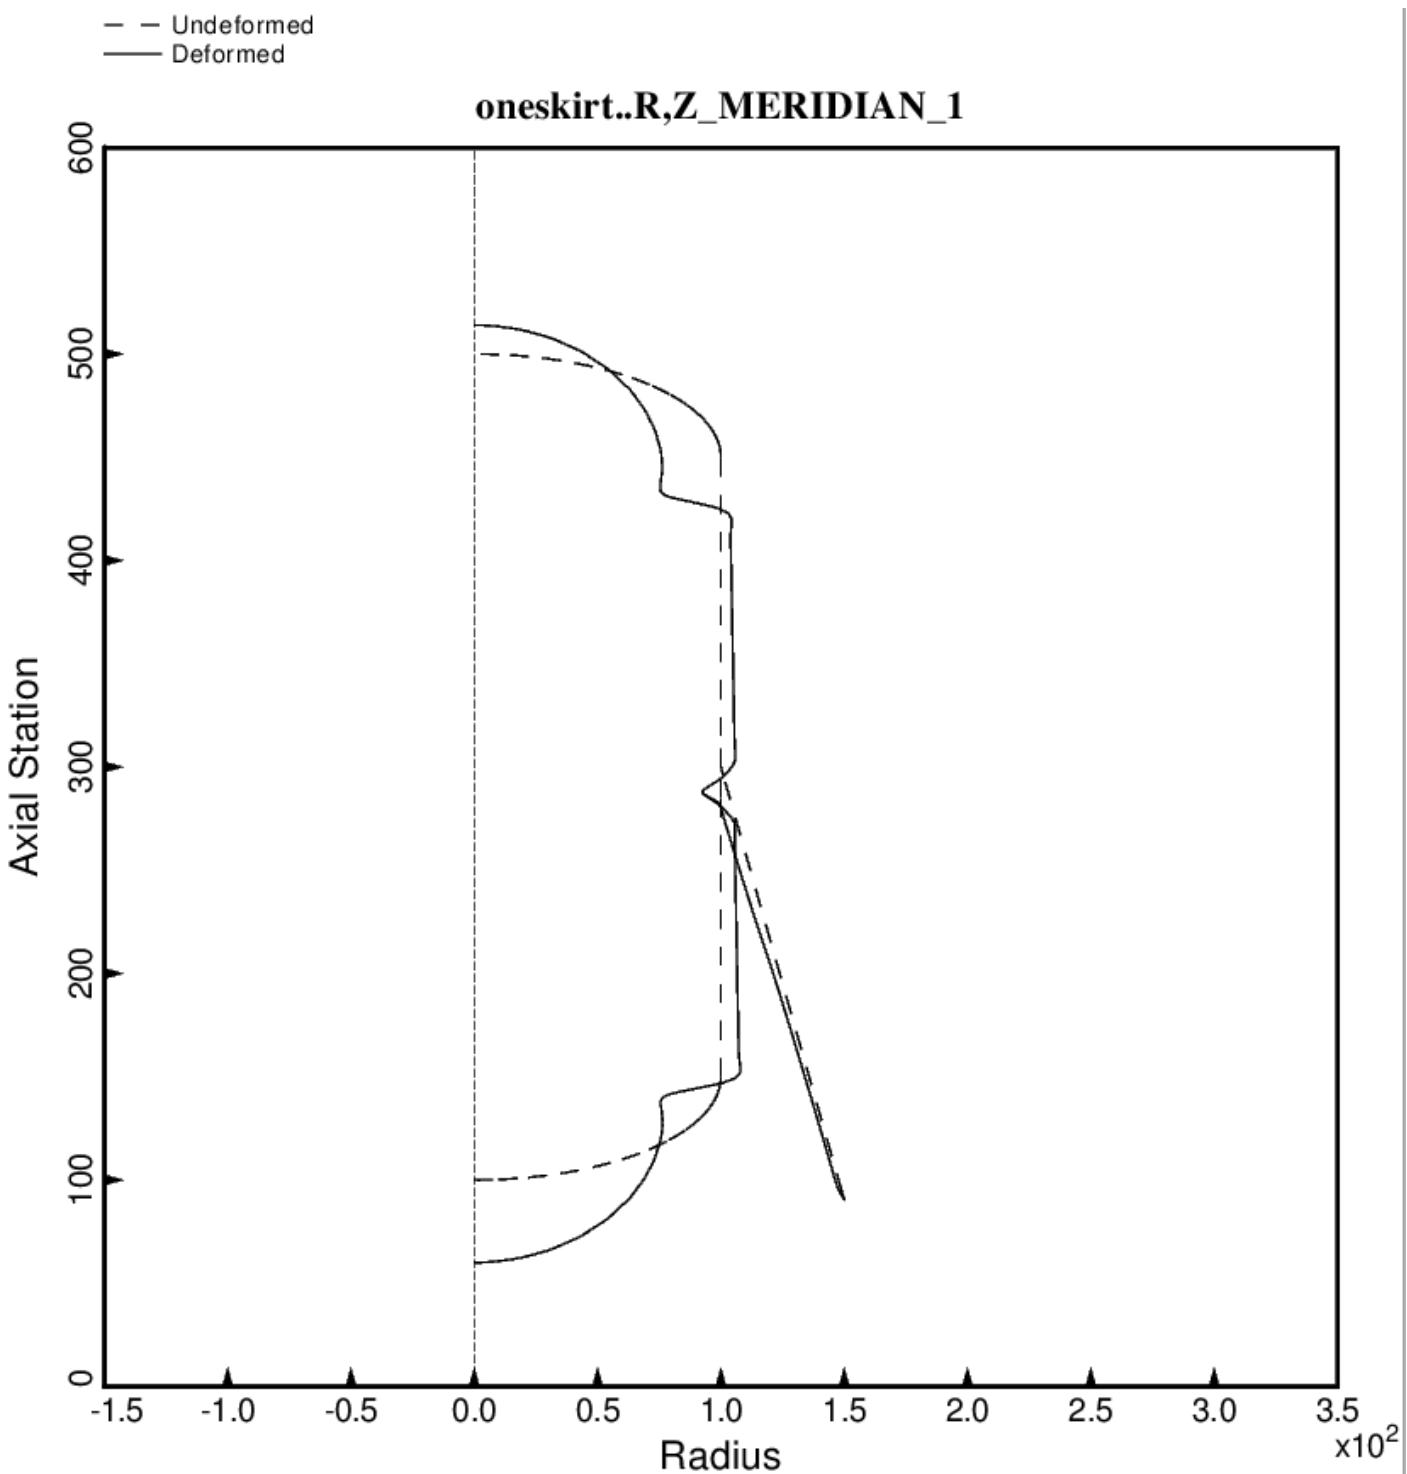

Fig. 7 (new) Axisymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The g-loading is AXIAL.

—— Undeformed  
 - - - Deformed

### oneskirt: 10g axial accel; axisymmetric prebuckling deformation

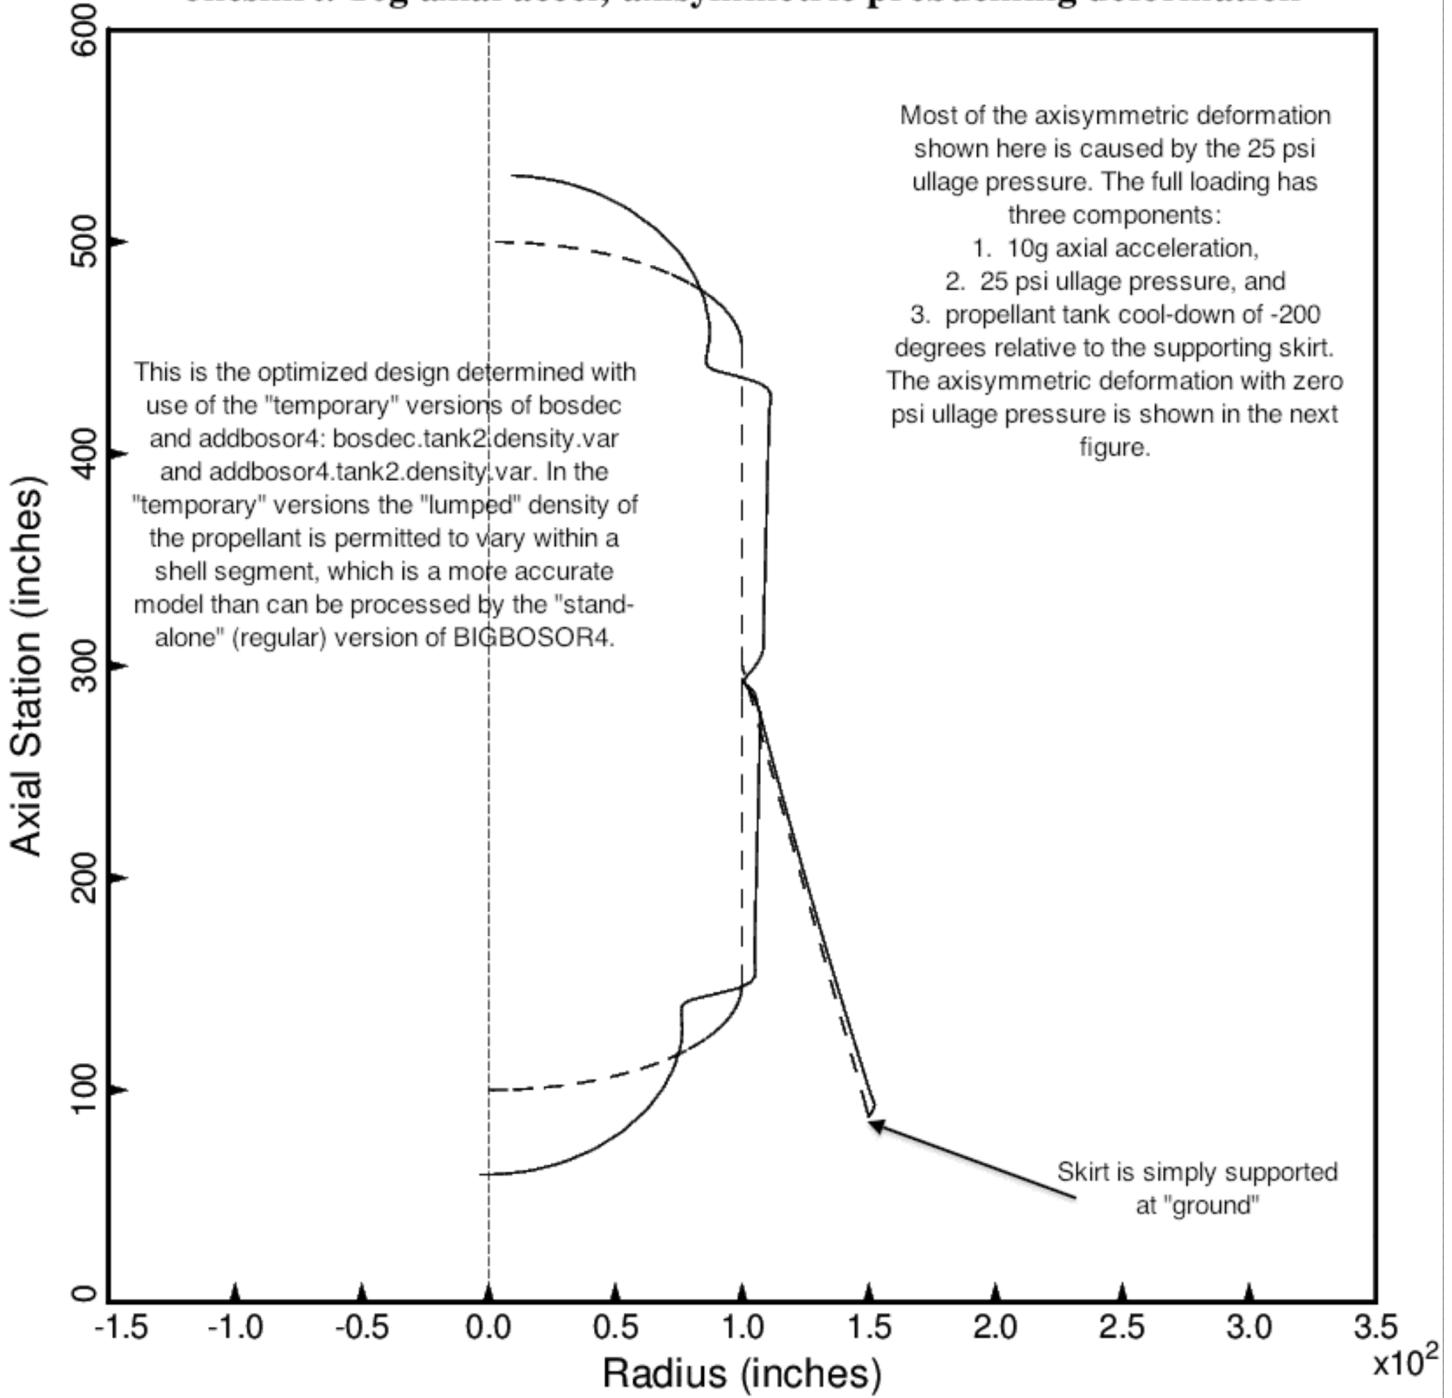

Fig. 7 (old) Axisymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the "temporary" versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The g-loading is AXIAL.

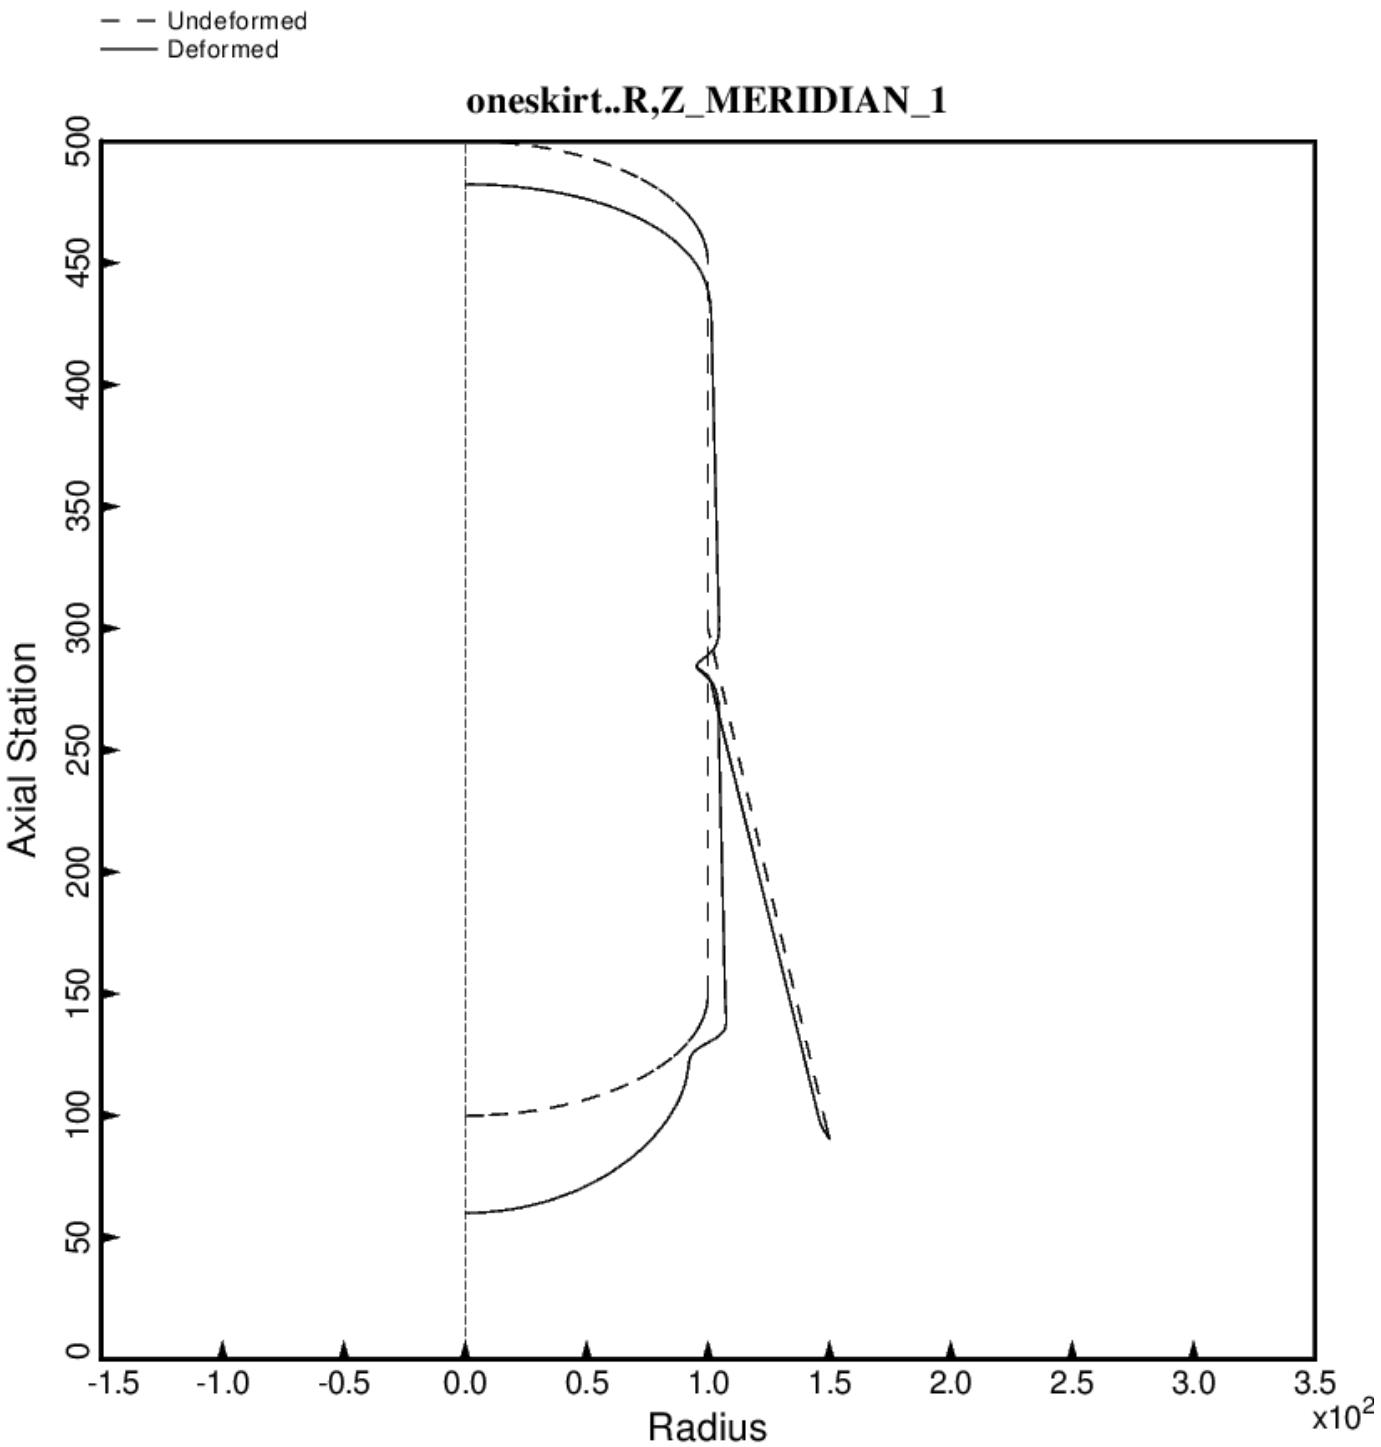

Fig. 8 (new) Axisymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). In this case the ullage pressure and the tank cool-down temperature are both zero. Compare with the previous two figures. The g-loading is AXIAL.

— — Undeformed  
 — Deformed

### oneskirt: 10g axial accel; 0 ullage pressure; axisym.deformation

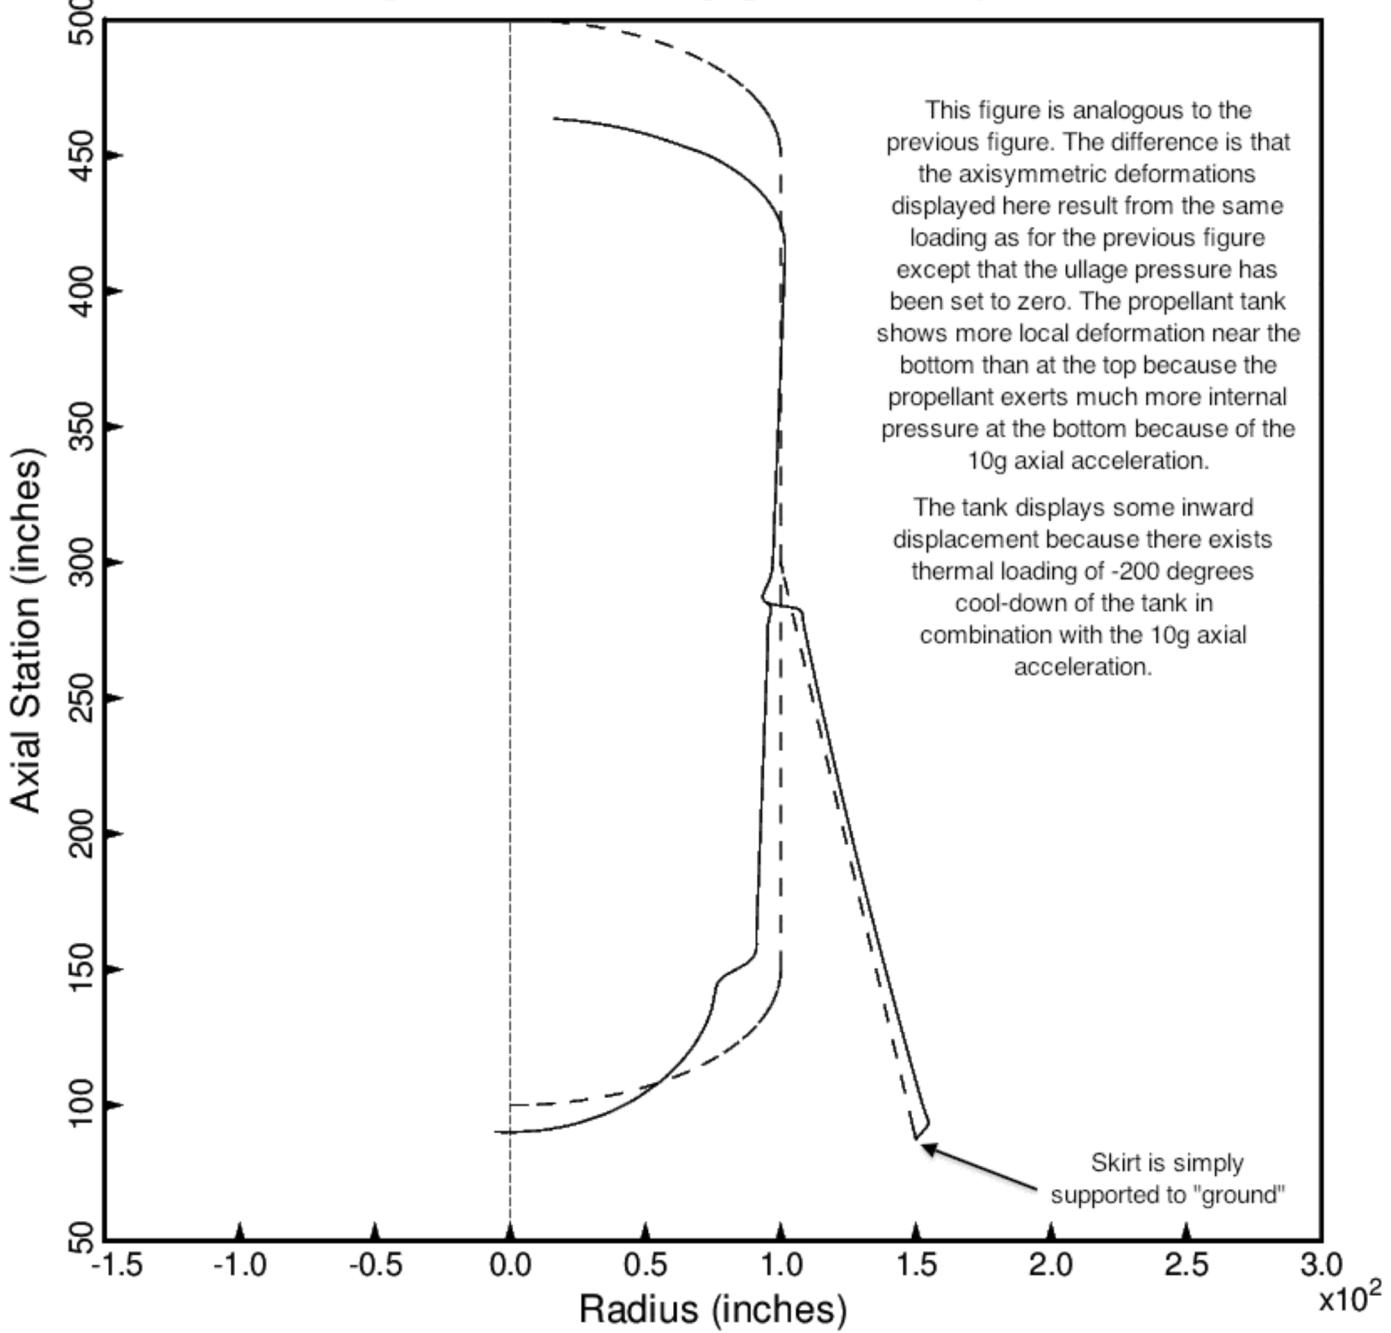

Fig. 8 (old) Axisymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). In this case the ullage pressure is zero. Compare with the previous figure. The g-loading is AXIAL.

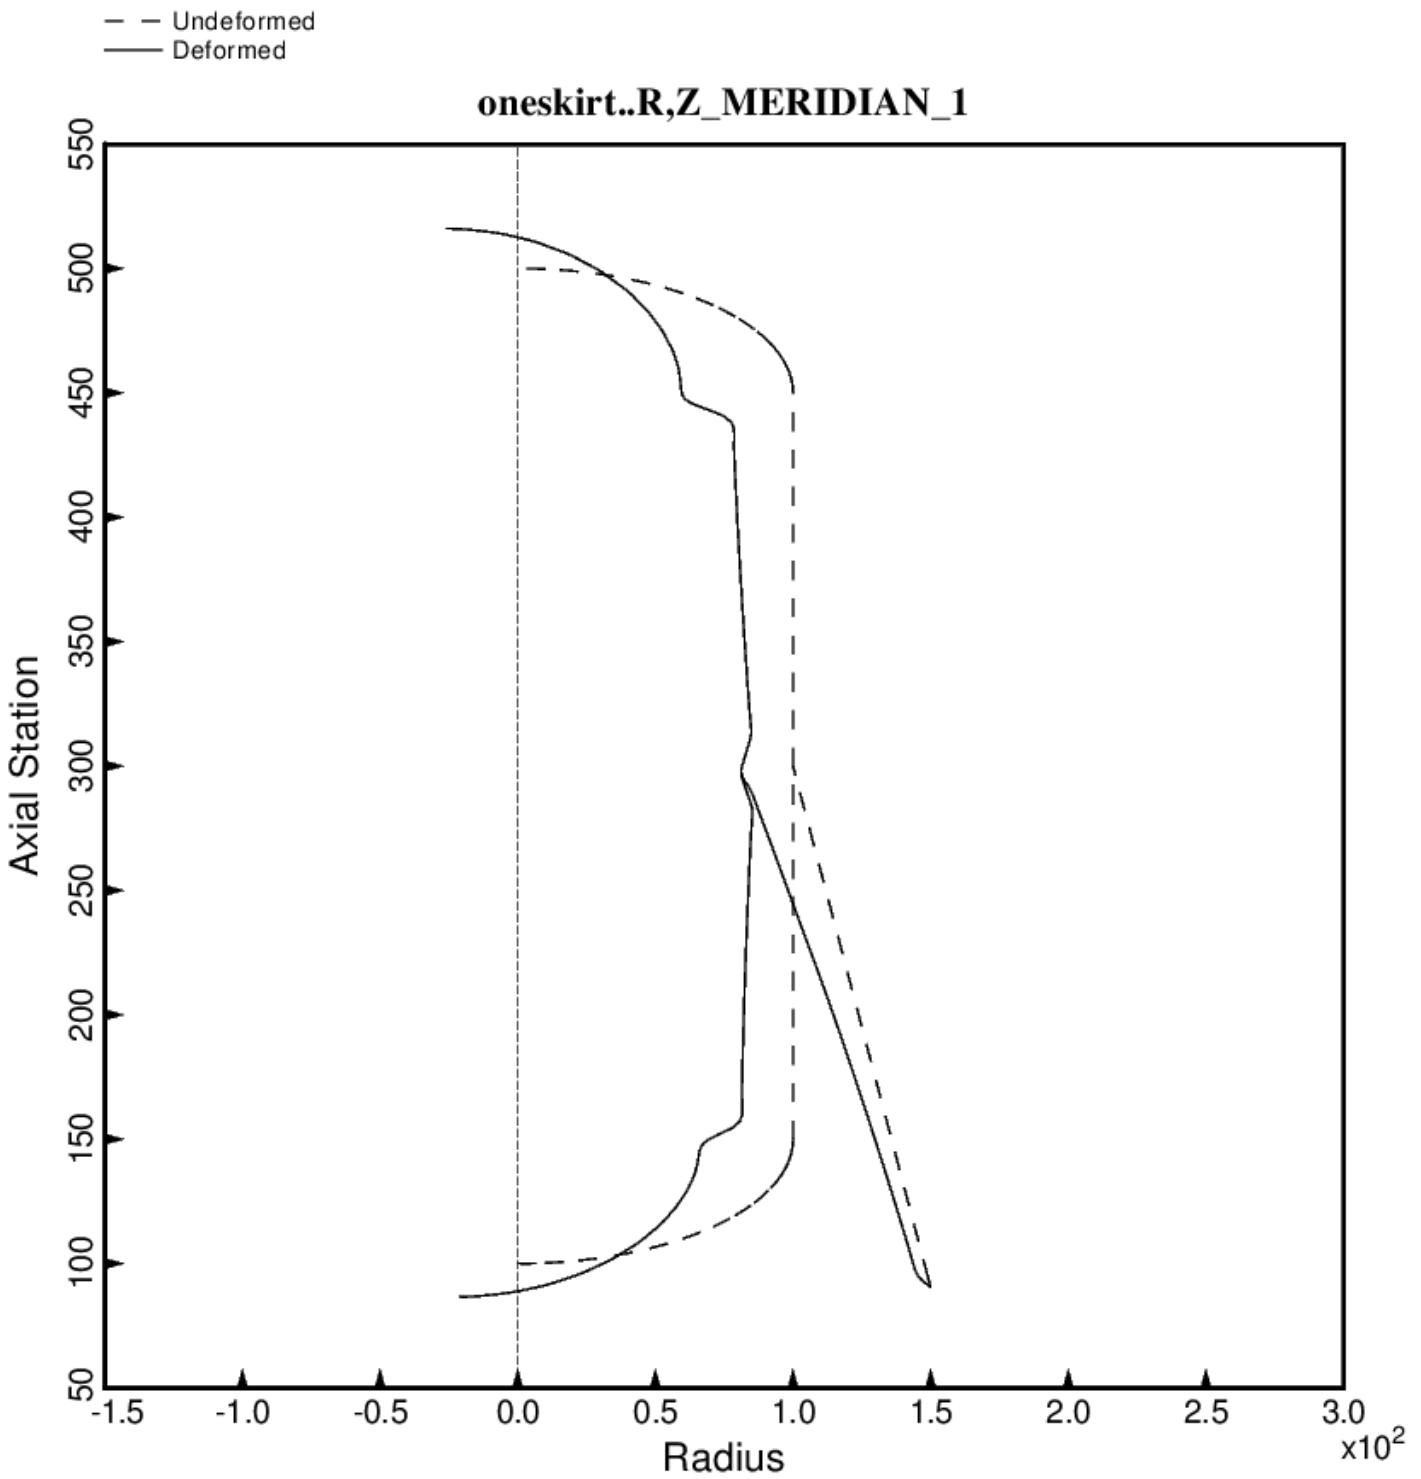

Fig. 9 (new) Nonsymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The g-loading is LATERAL.

-- Undeformed  
 — Deformed

### oneskirt: 10g lateral accel; prebuckling deformed along 0-deg.meridian

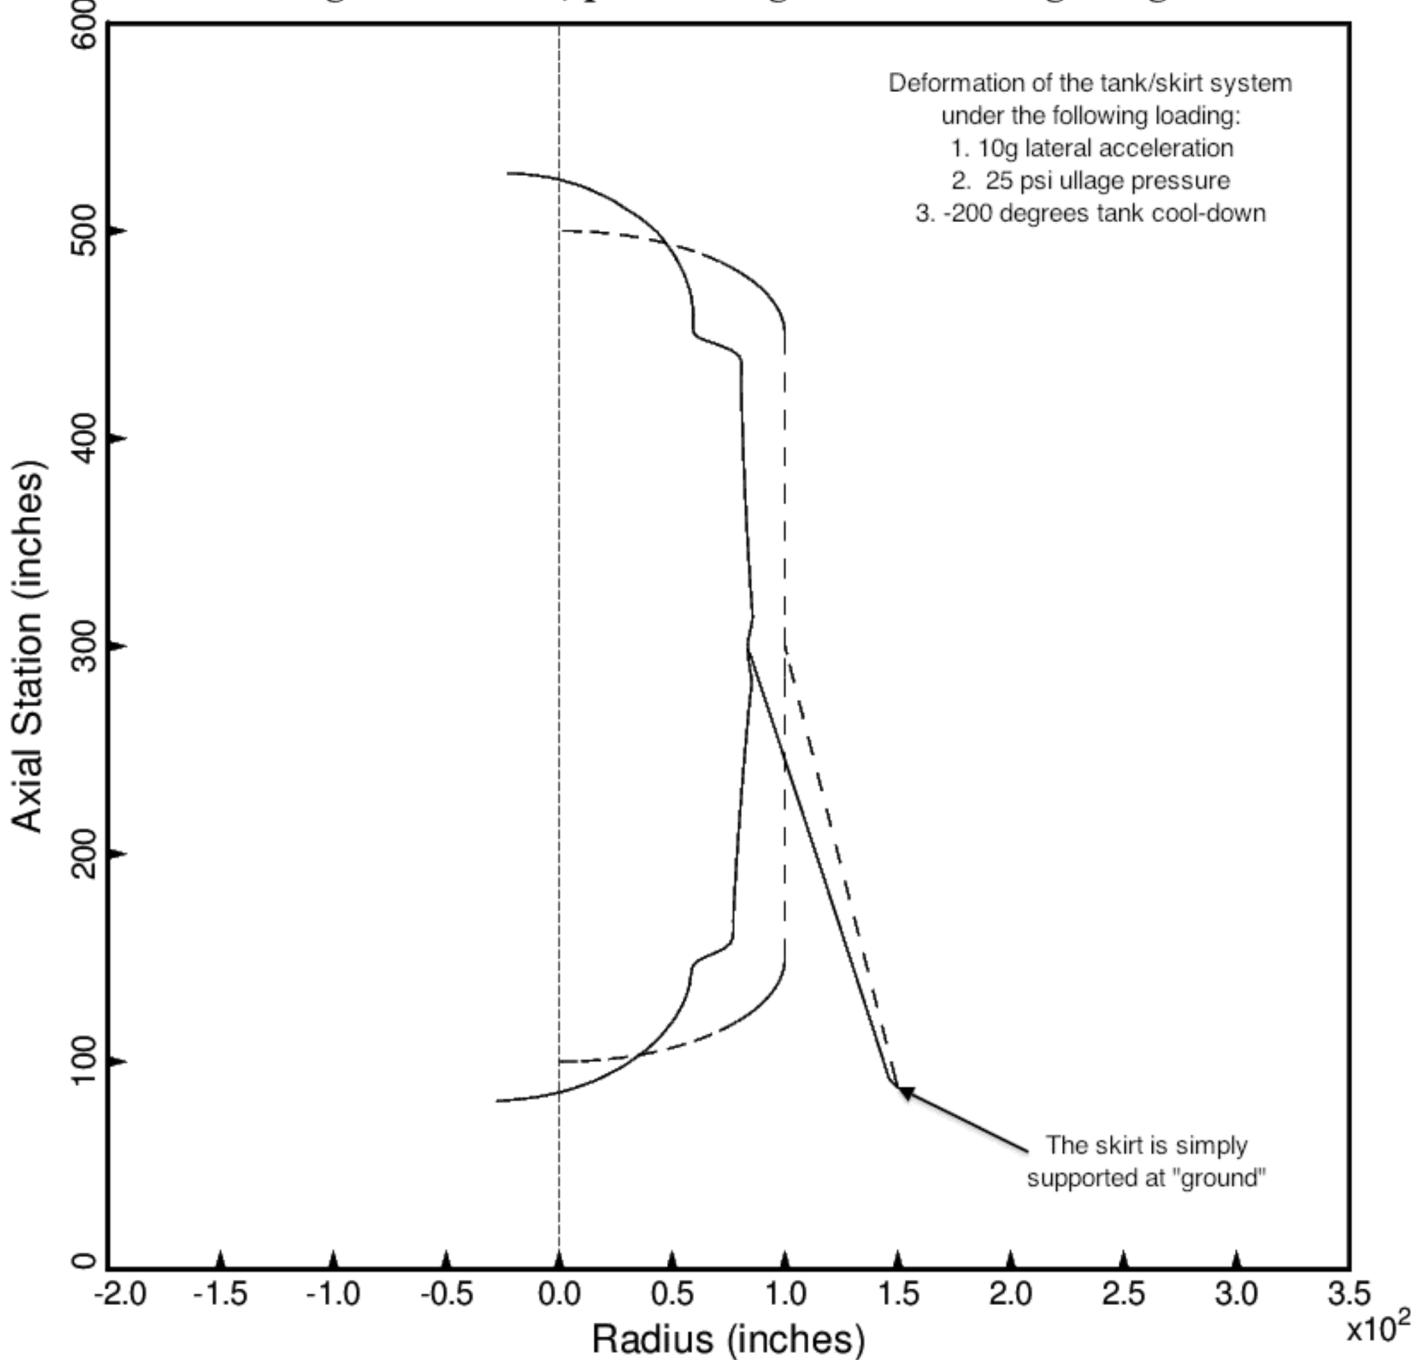

Fig. 9 (old) Nonsymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the "temporary" versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The g-loading is LATERAL.

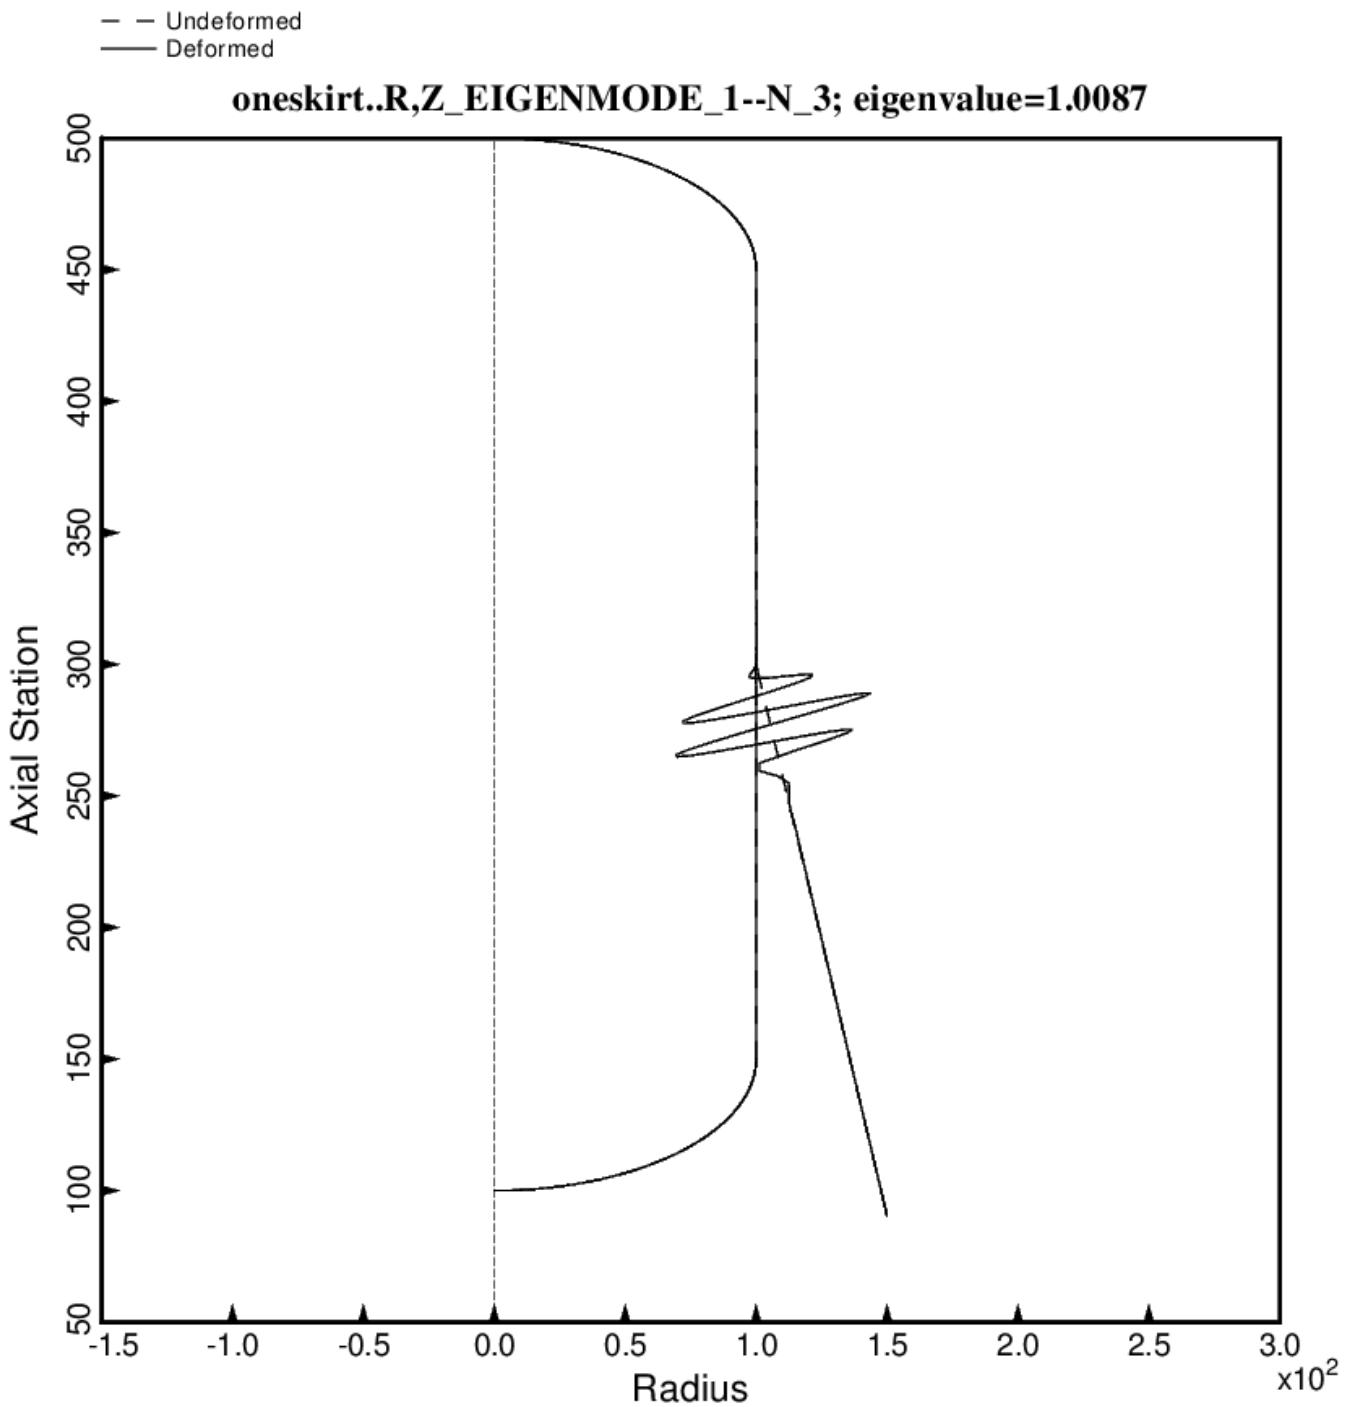

Fig. 10 (new) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g AXIAL acceleration. For  $n = 3$  circumferential waves the lowest buckling load factor corresponds to short-axial-wavelength buckling of the skirt.

- - Undeformed  
 — Deformed

**oneskirt: 10g axial accel; N=3 circ.waves; buckling eigenvalue=1.685**

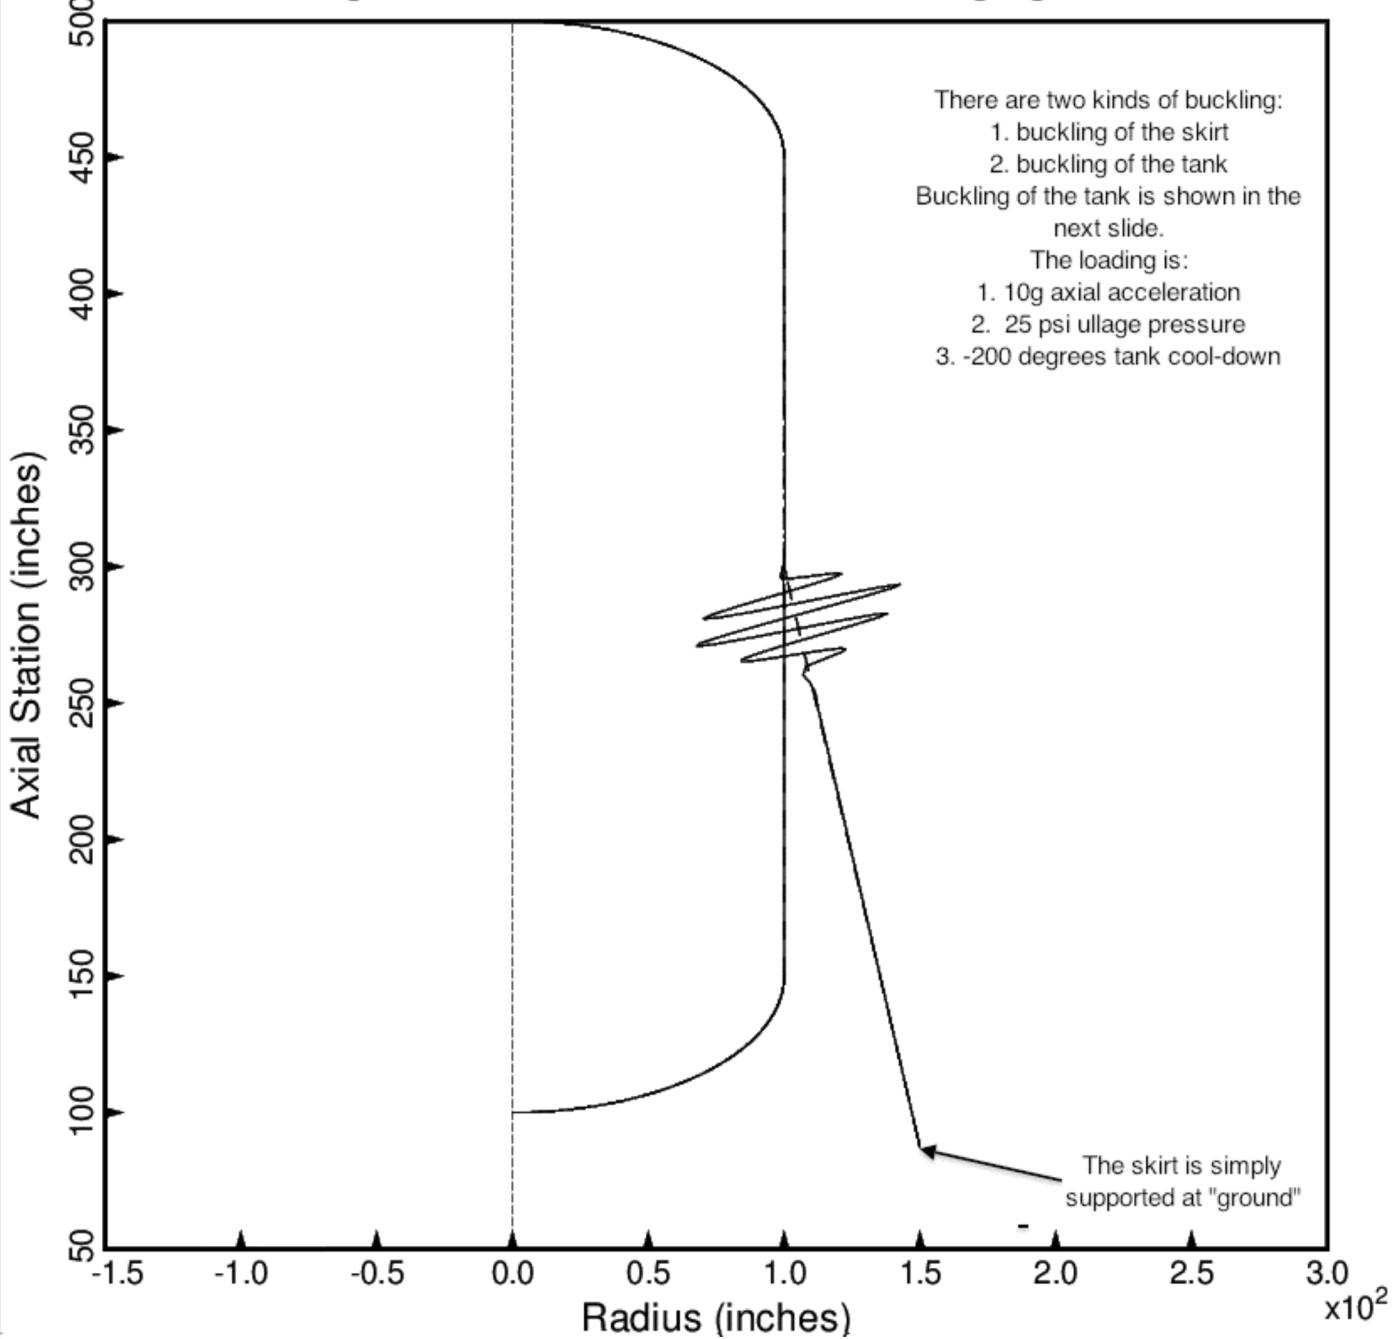

Fig. 10 (old) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor (addbosor4.tank2.density.var). The inertial loading is 10g AXIAL acceleration. For  $n = 3$  circumferential waves the lowest buckling load factor corresponds to short-axial-wavelength buckling of the skirt.

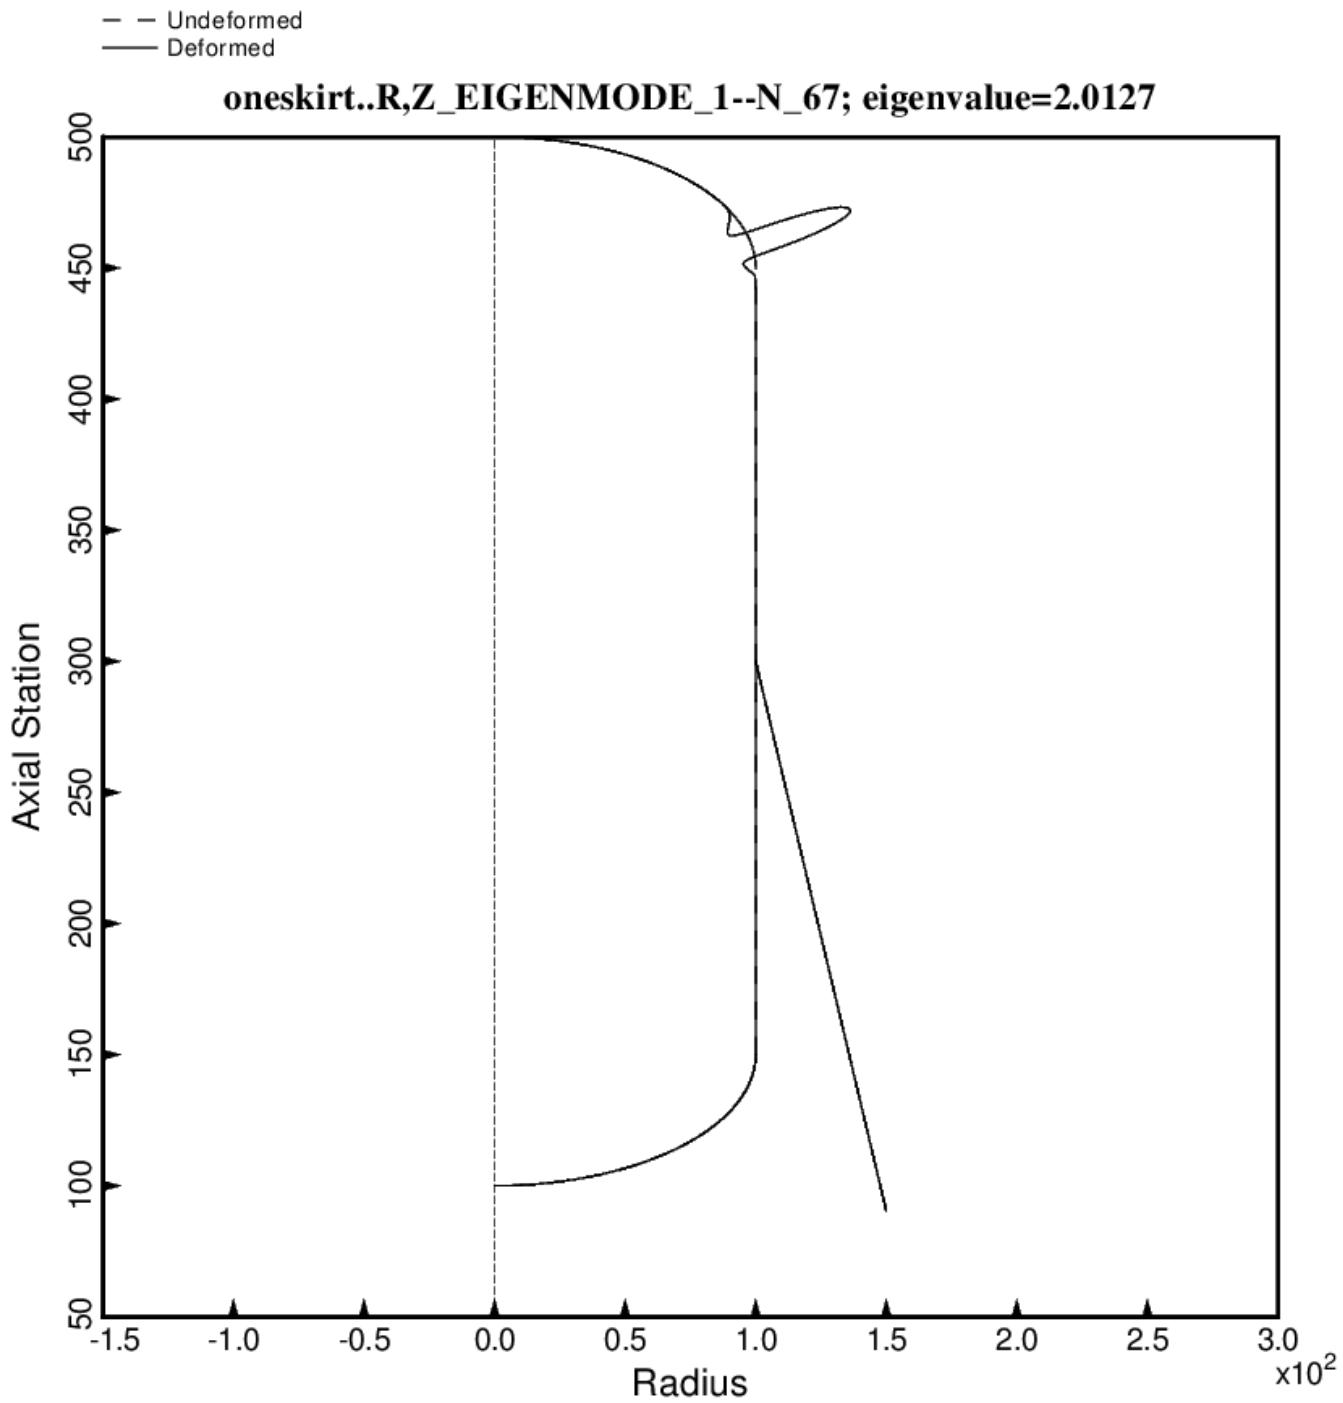

Fig. 11 (new) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g AXIAL acceleration. For  $n = 67$  circumferential waves the lowest buckling load factor corresponds to short-circumferential-wavelength buckling of the upper 2:1 ellipsoidal dome of the propellant tank under internal pressure.

- - - Undeformed  
 — Deformed

**oneskirt: 10g axial accel; N=55 circ.waves;buckling eigenvalue=1.2307**

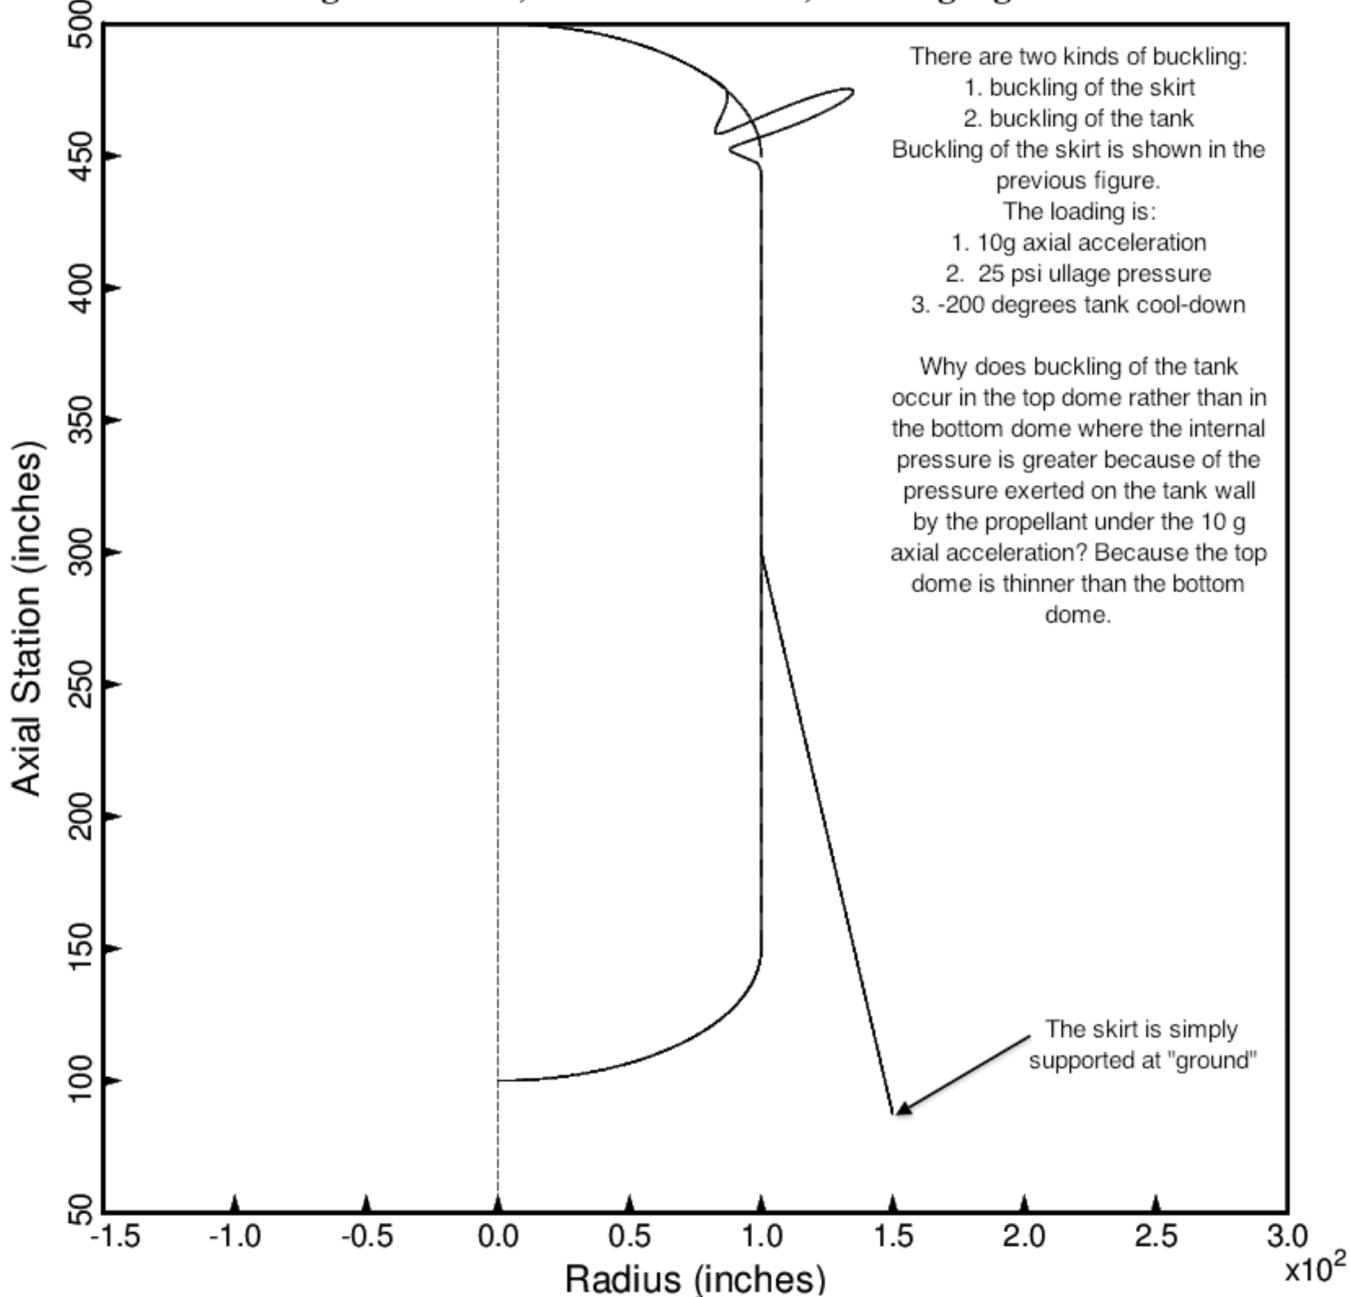

Fig. 11 (old) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g AXIAL acceleration. For  $n = 55$  circumferential waves the lowest buckling load factor corresponds to short-circumferential-wavelength buckling of the upper 2:1 ellipsoidal dome of the propellant tank under internal pressure.

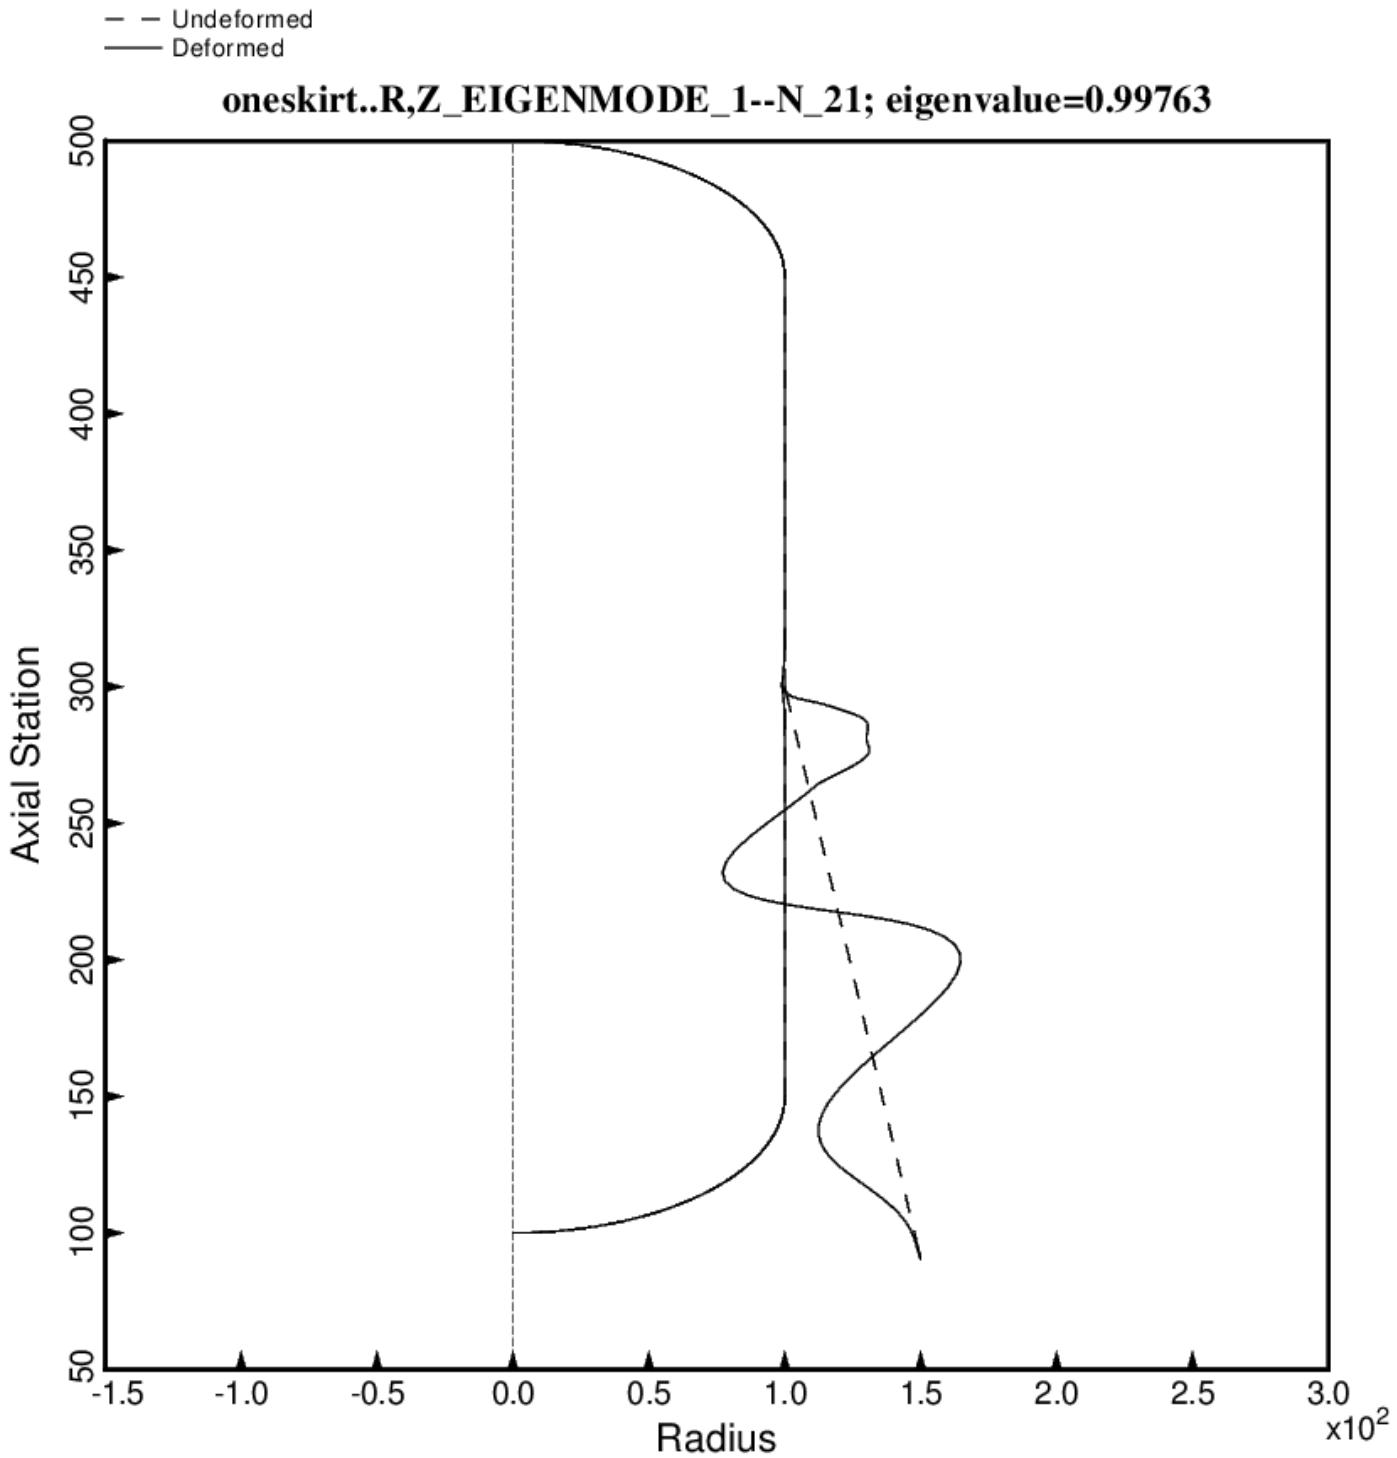

Fig. 12 (new) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g LATERAL acceleration. For  $n = 21$  circumferential waves the lowest buckling load factor corresponds to long-axial-wavelength buckling of the skirt.

—— Undeformed  
 — Deformed

**oneskirt: 10g lateral accel; N=13 circ.waves; buckling eigenvalue=0.99639**

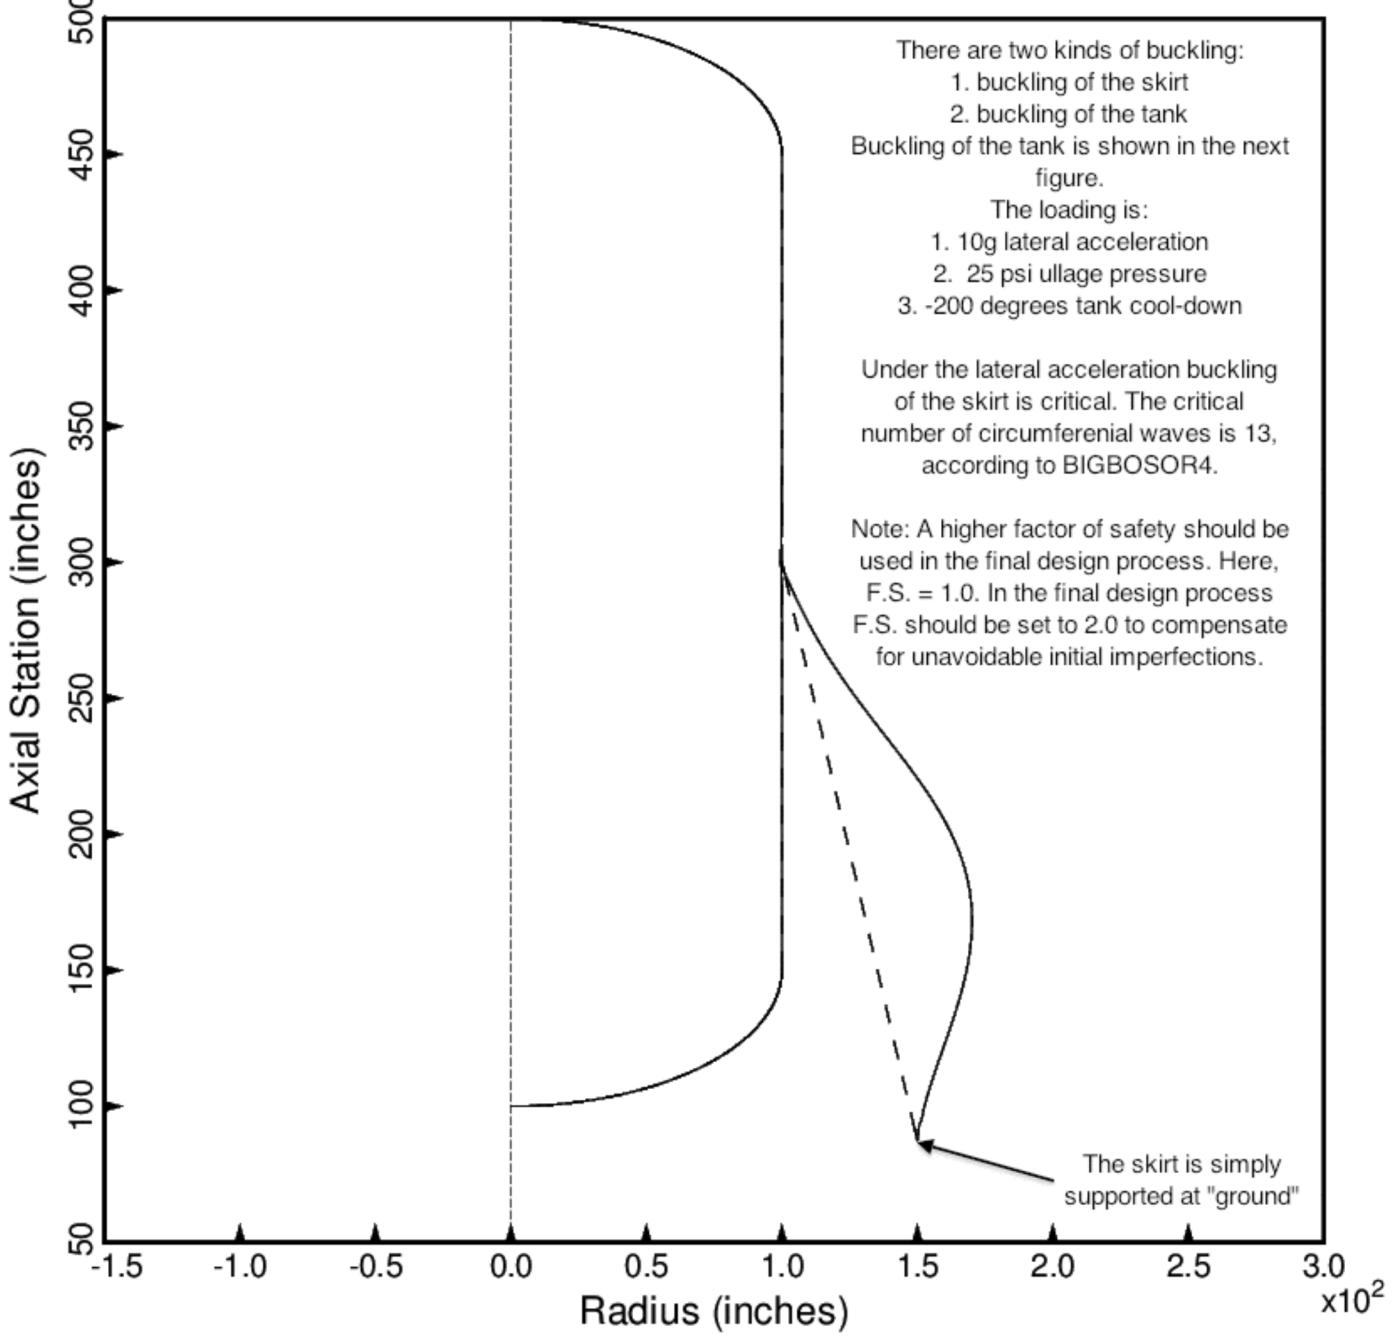

Fig. 12 (old) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g LATERAL acceleration. For  $n = 13$  circumferential waves the lowest buckling load factor corresponds to long-axial-wavelength buckling of the skirt.

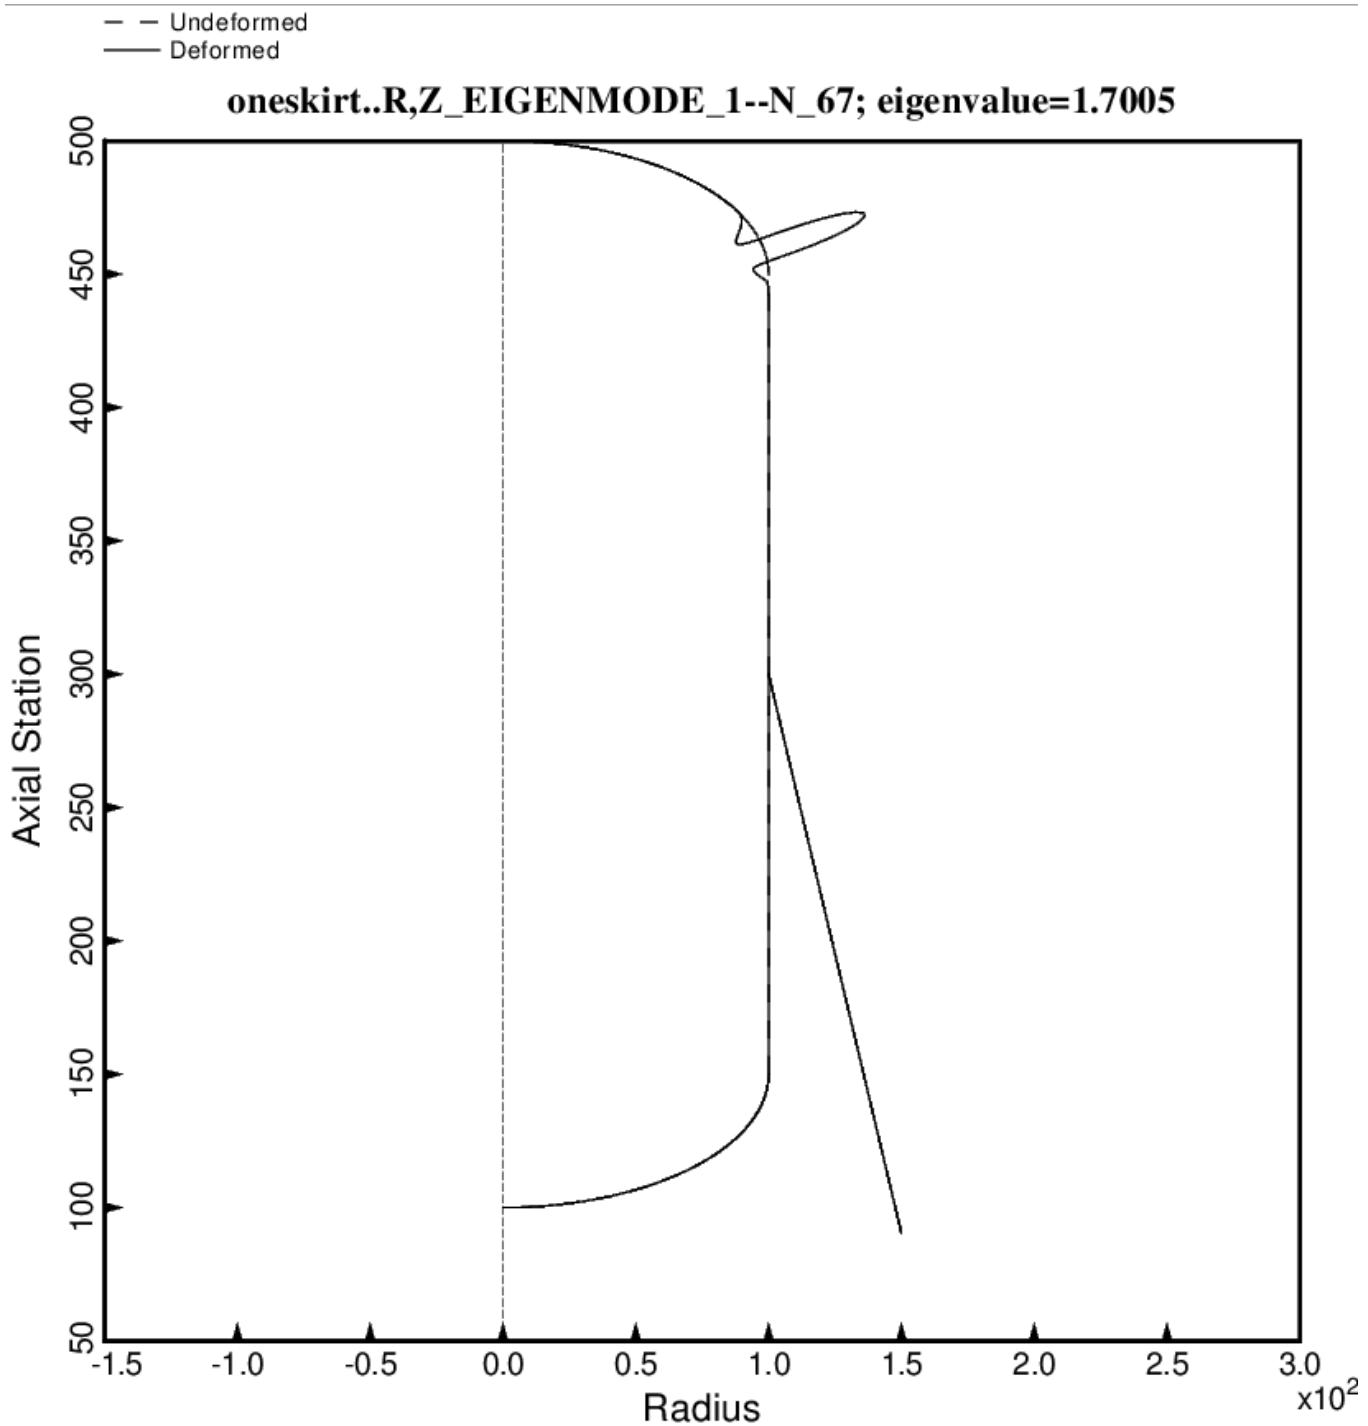

Fig. 13 (new) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g LATERAL acceleration. For  $n = 67$  circumferential waves the lowest buckling load factor corresponds to short-circumferential buckling of the forward dome under internal pressure.

- - - Undeformed  
 — Deformed

**oneskirt: 10g lateral accel; N=53 circ.waves; buckling eigenvalue=1.1007**

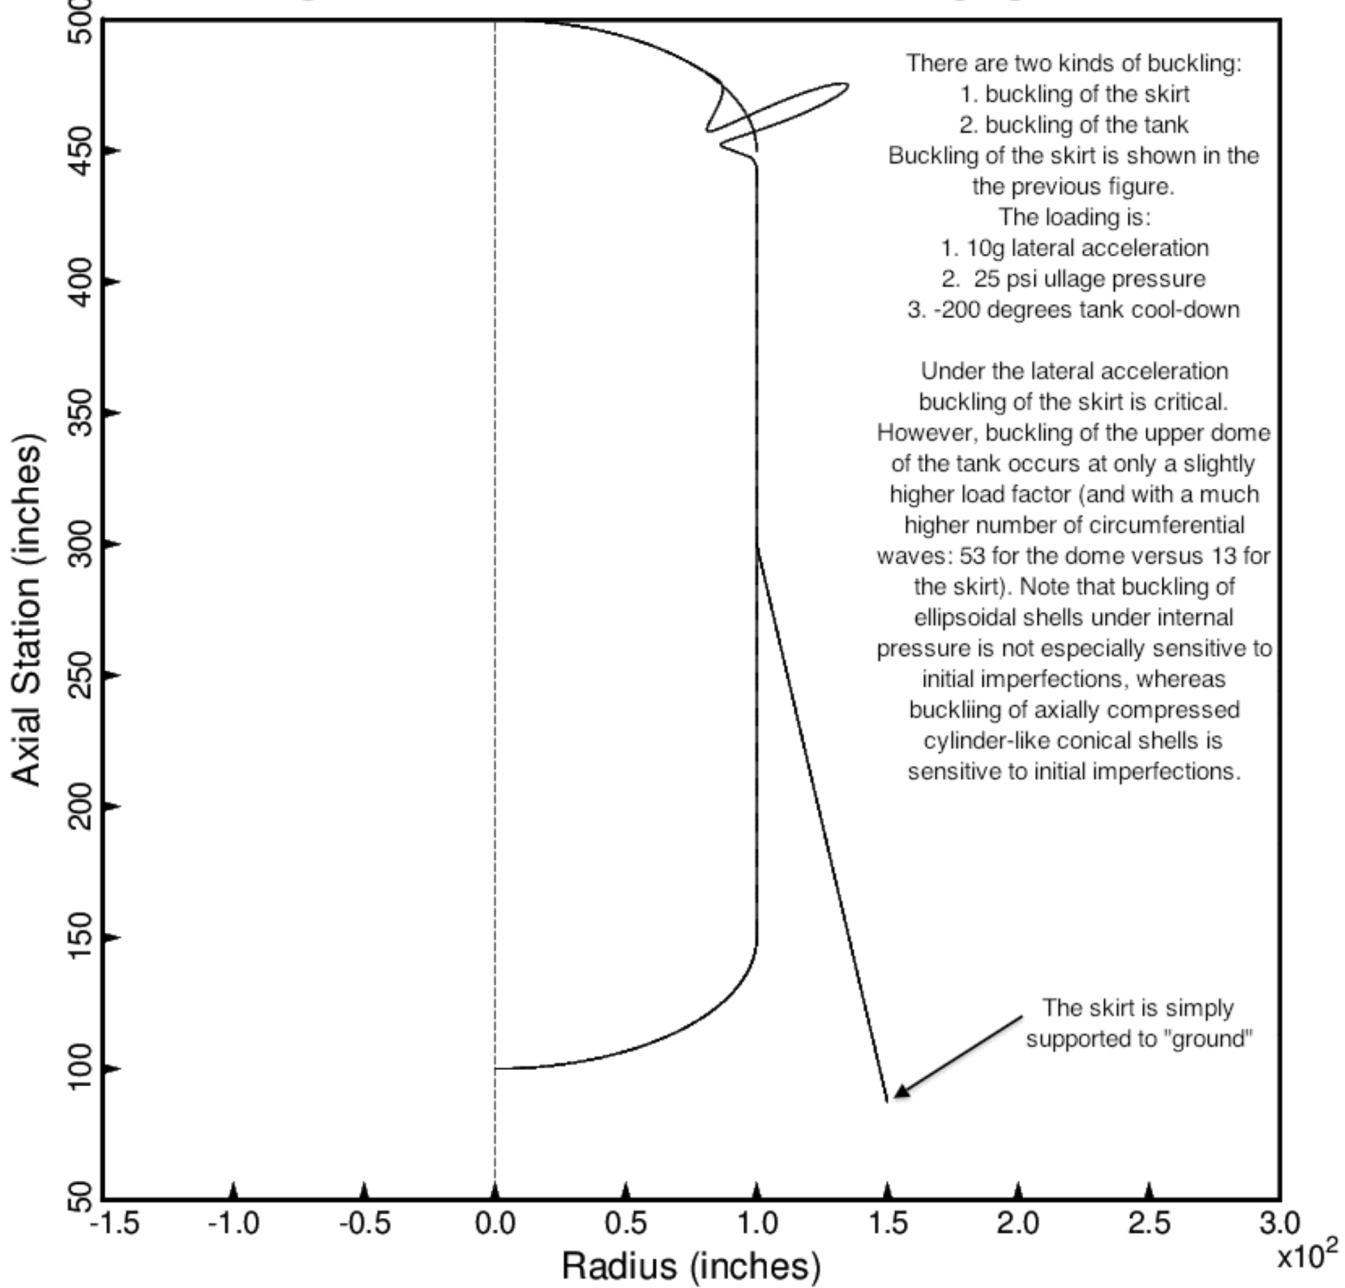

Fig. 13 (old) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g LATERAL acceleration. For  $n = 53$  circumferential waves the lowest buckling load factor corresponds to short-circumferential buckling of the forward dome under internal pressure.

### GENOPT oneskirt: design margins vs ANGLE(5)

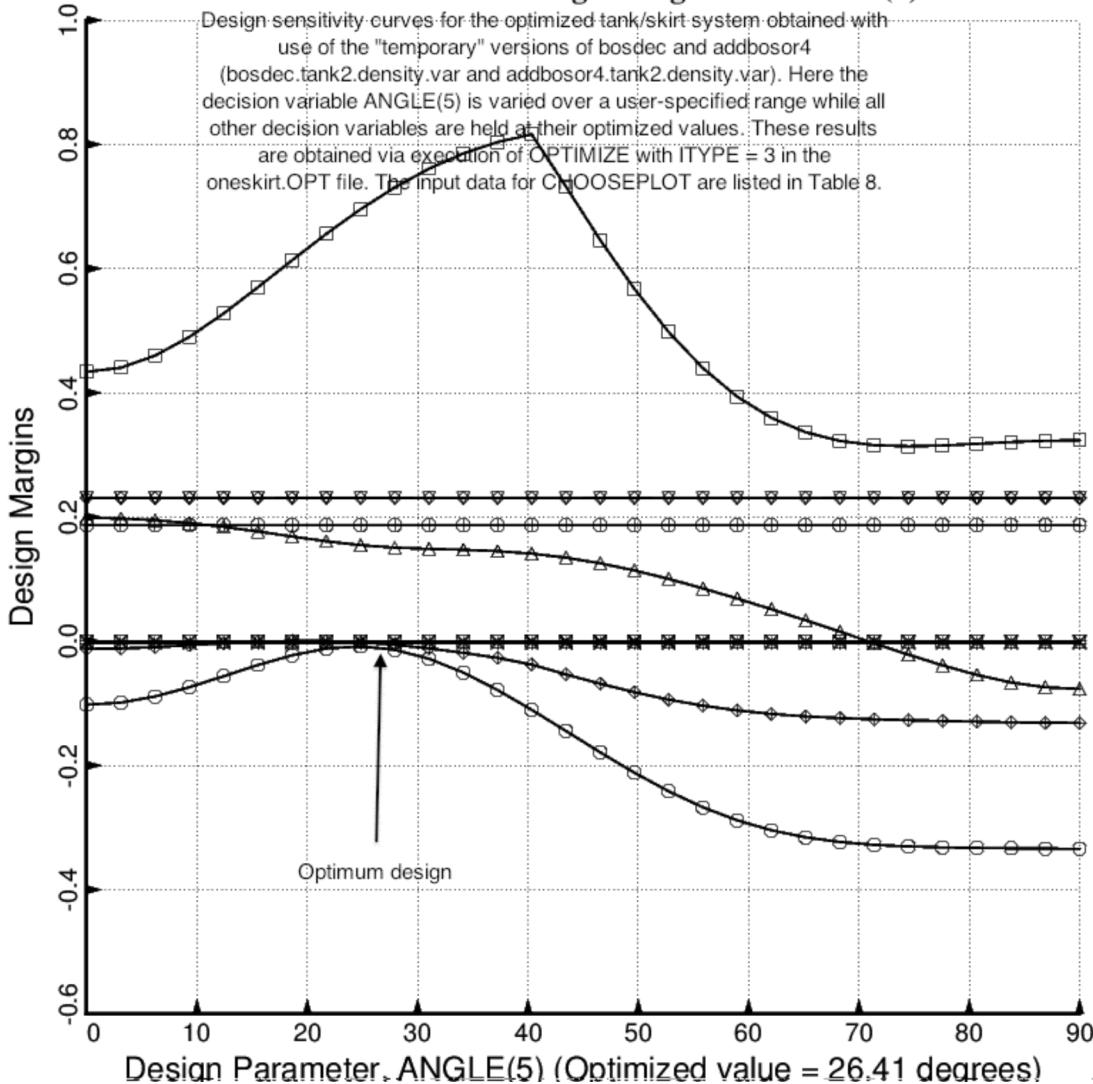

Fig. 21 (old) Design sensitivity with respect to the decision variable, ANGLE(5), of the optimized tank/skirt system determined with use of the "temporary" versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). **NOTE:** This and the previous several figures were generated with the old optimum design obtained before certain corrections were made to the "tank2" software: behavior.tank2, bosdec.tank2 and bosdec.tank2.density.var. Please think of these figures only as a demonstration of the capability of GENOPT/BIGBOSOR4 to perform design sensitivity analyses of the sort shown here.

### GENOPT twoskirt: objective vs design iterations

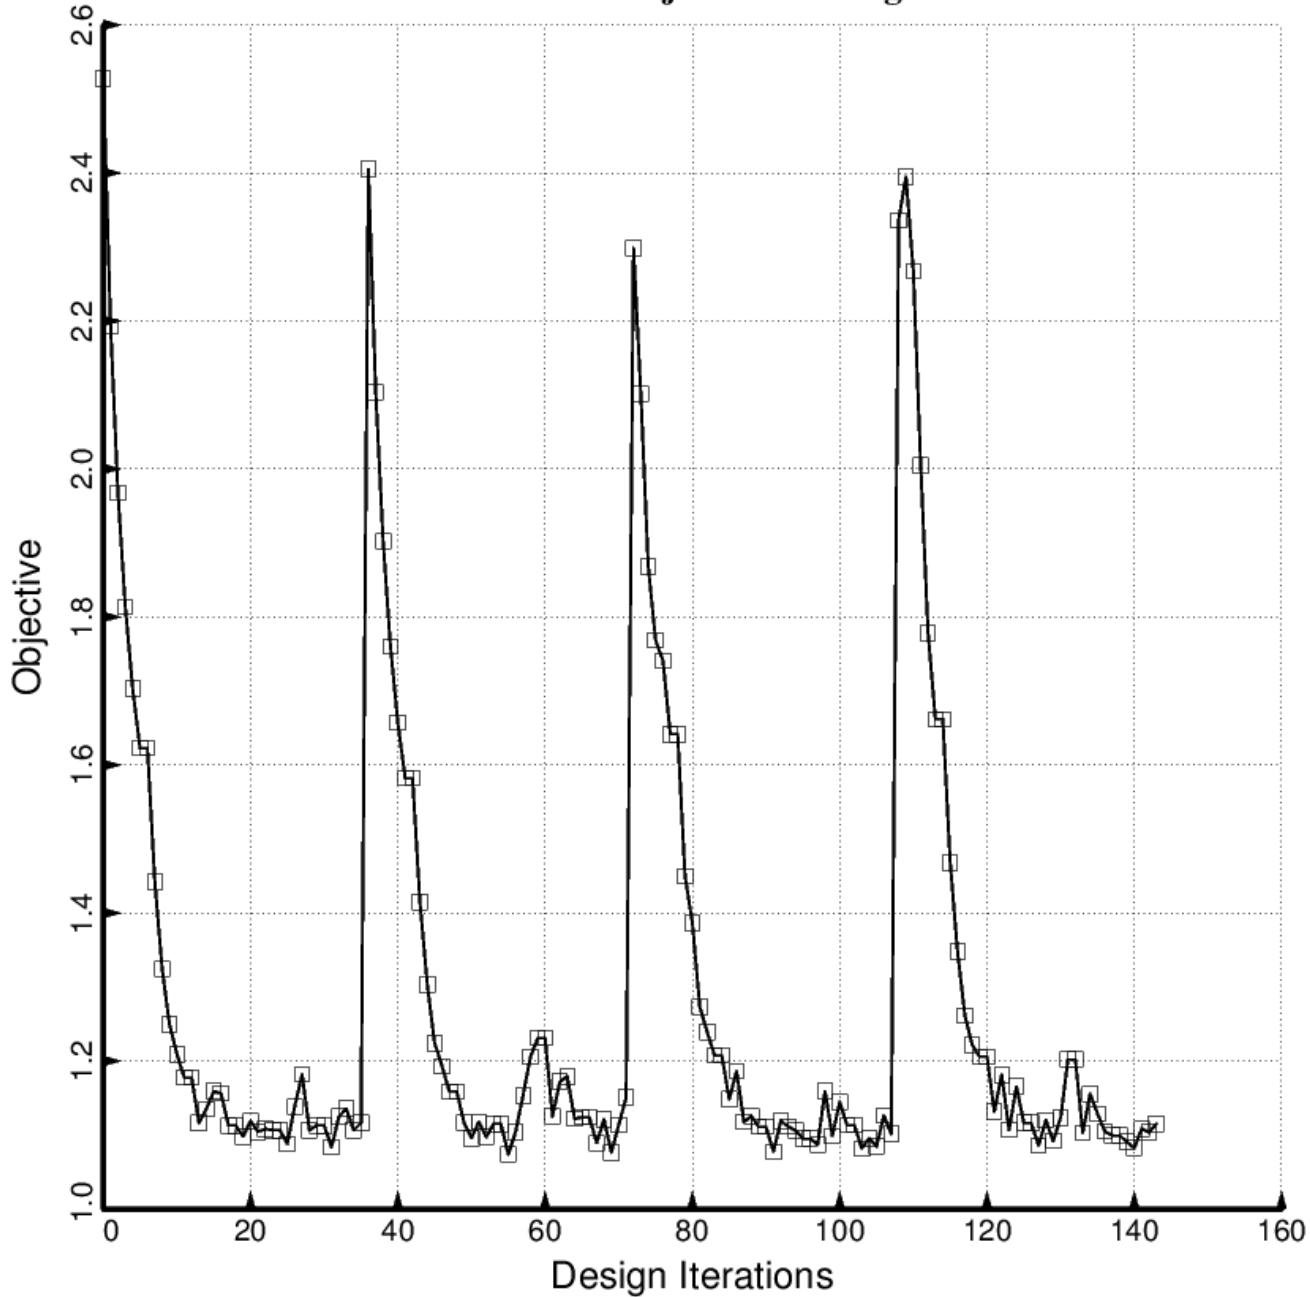

Fig. 22a (new) Evolution of the objective during a partial execution of SUPEROPT for the specific case, “twoskirt” obtained with the use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The “twoskirt” input variables are listed in twoskirt.BEG and the decision variables are listed in twoskirt.DEC. This and the next several slides pertain to the specific case called “twoskirt”. In order to treat “twoskirt” the GENOPT software had to be modified to permit more decision variable candidates.

### GENOPT twoskirt: objective vs design iterations

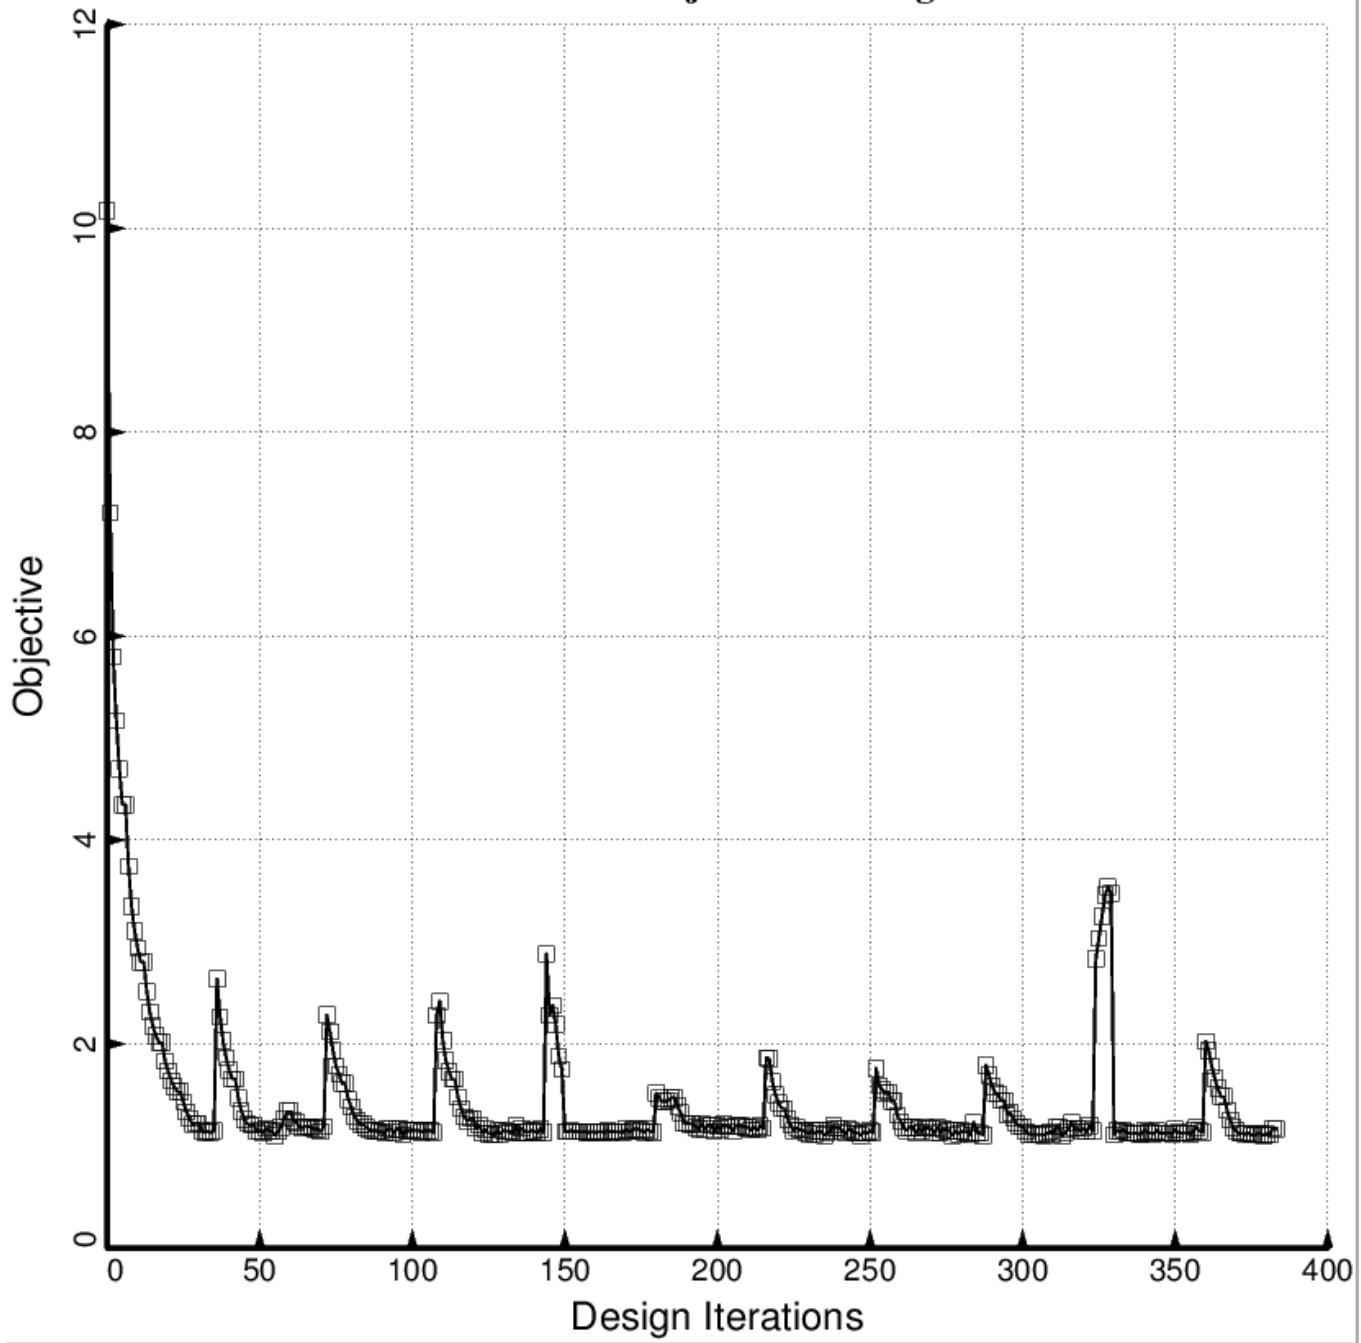

Fig. 22b (new) Evolution of the objective during a partial execution of SUPEROPT for the specific case, "twoskirt" obtained with the use of the "permanent" versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular). The "twoskirt" input variables are listed in twoskirt.BEG and the decision variables are listed in twoskirt.DEC. This and the next several slides pertain to the specific case called "twoskirt". In order to treat "twoskirt" the GENOPT software had to be modified to permit more decision variable candidates.

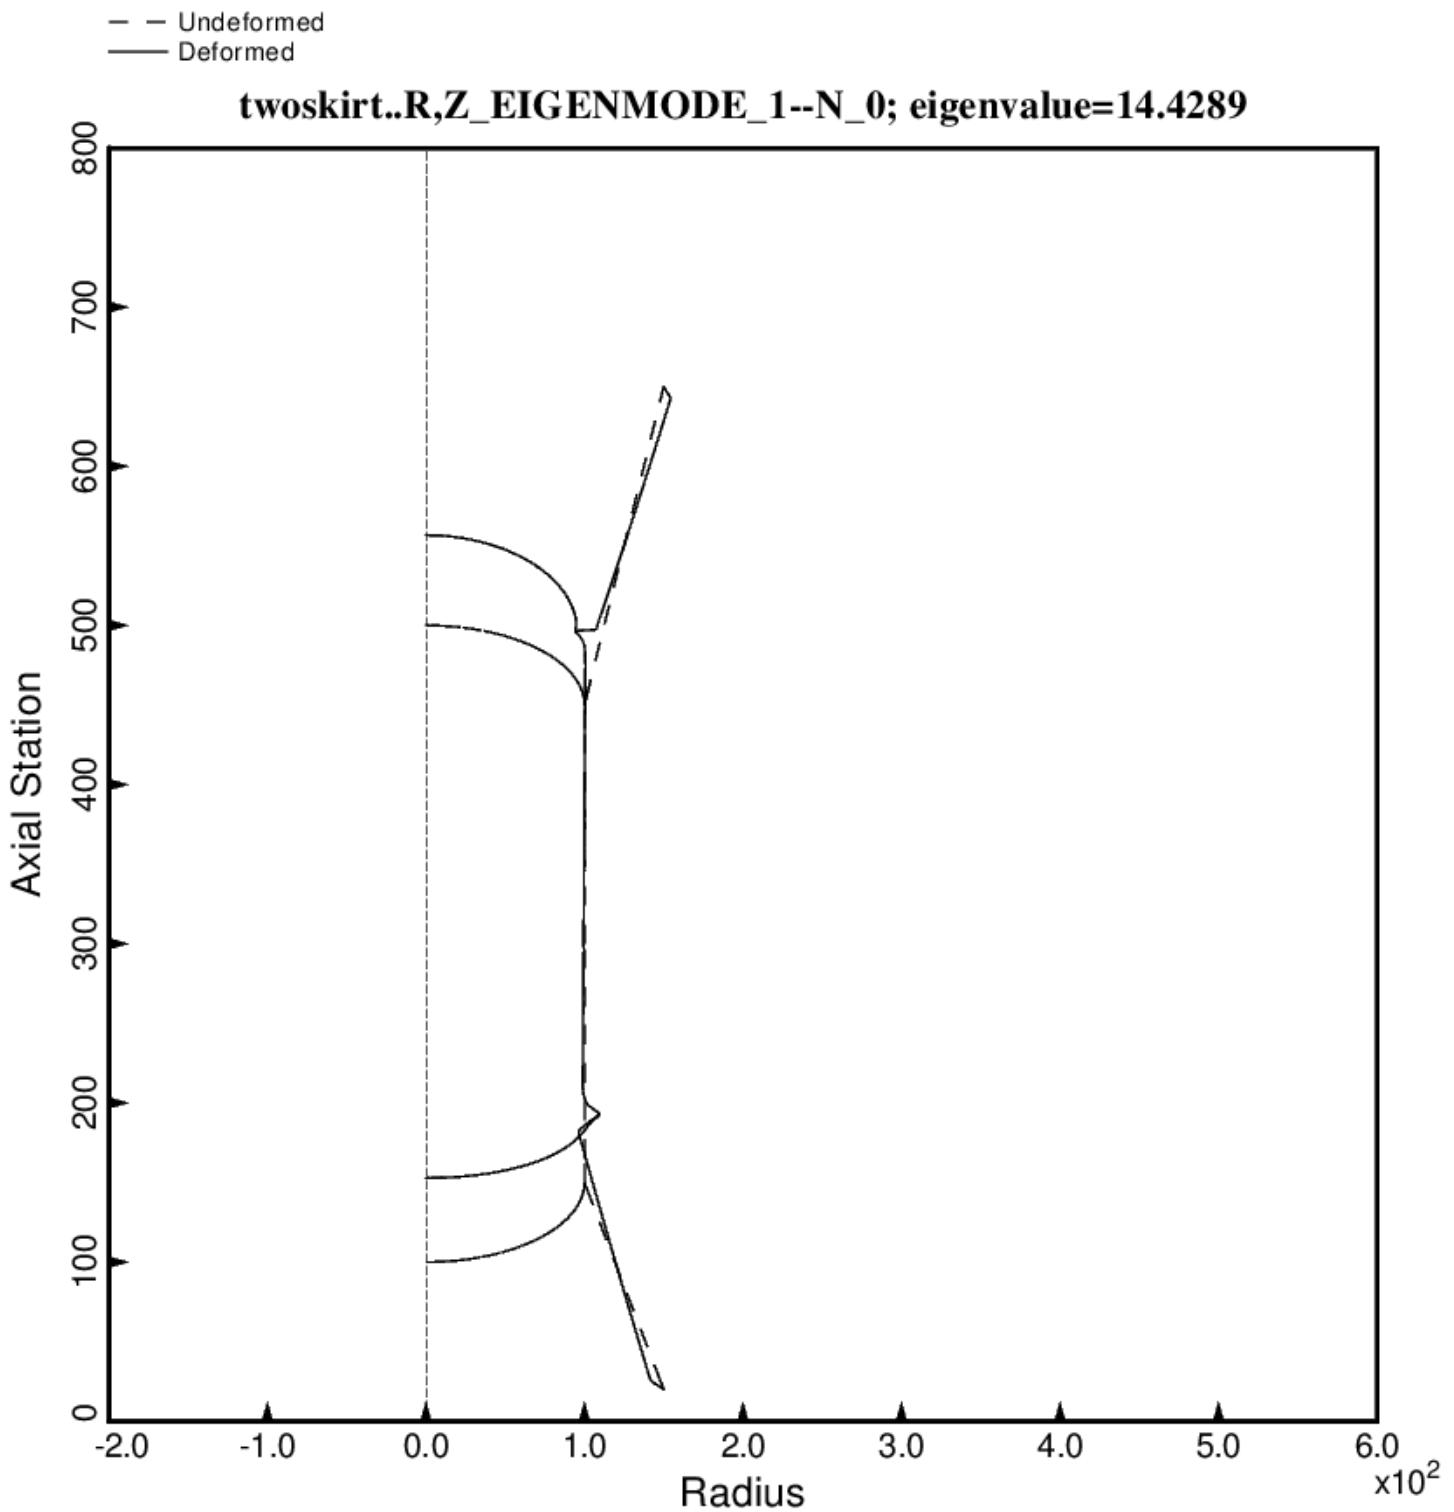

Fig. 23 (new) Axisymmetric axial vibration mode for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

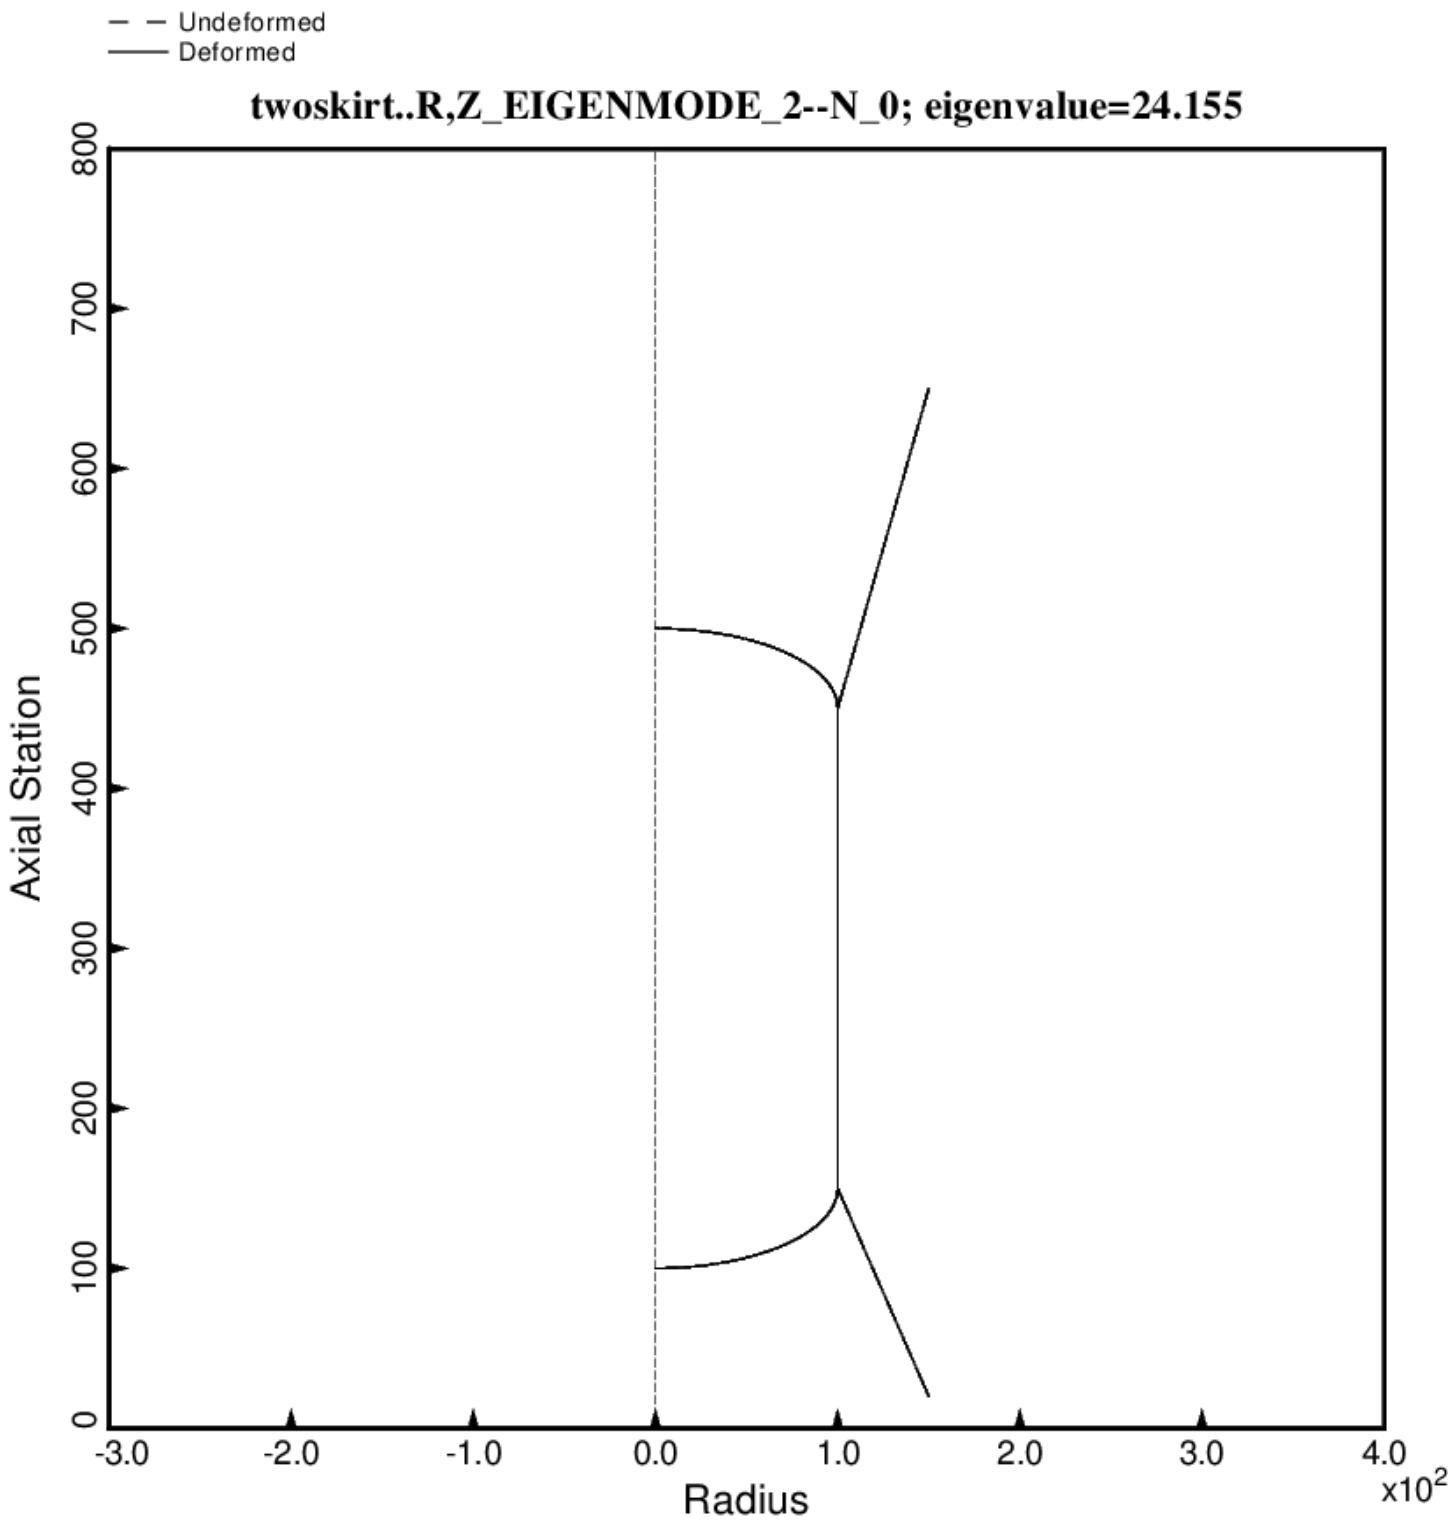

Fig. 24 (new) Axisymmetric rolling vibration mode for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

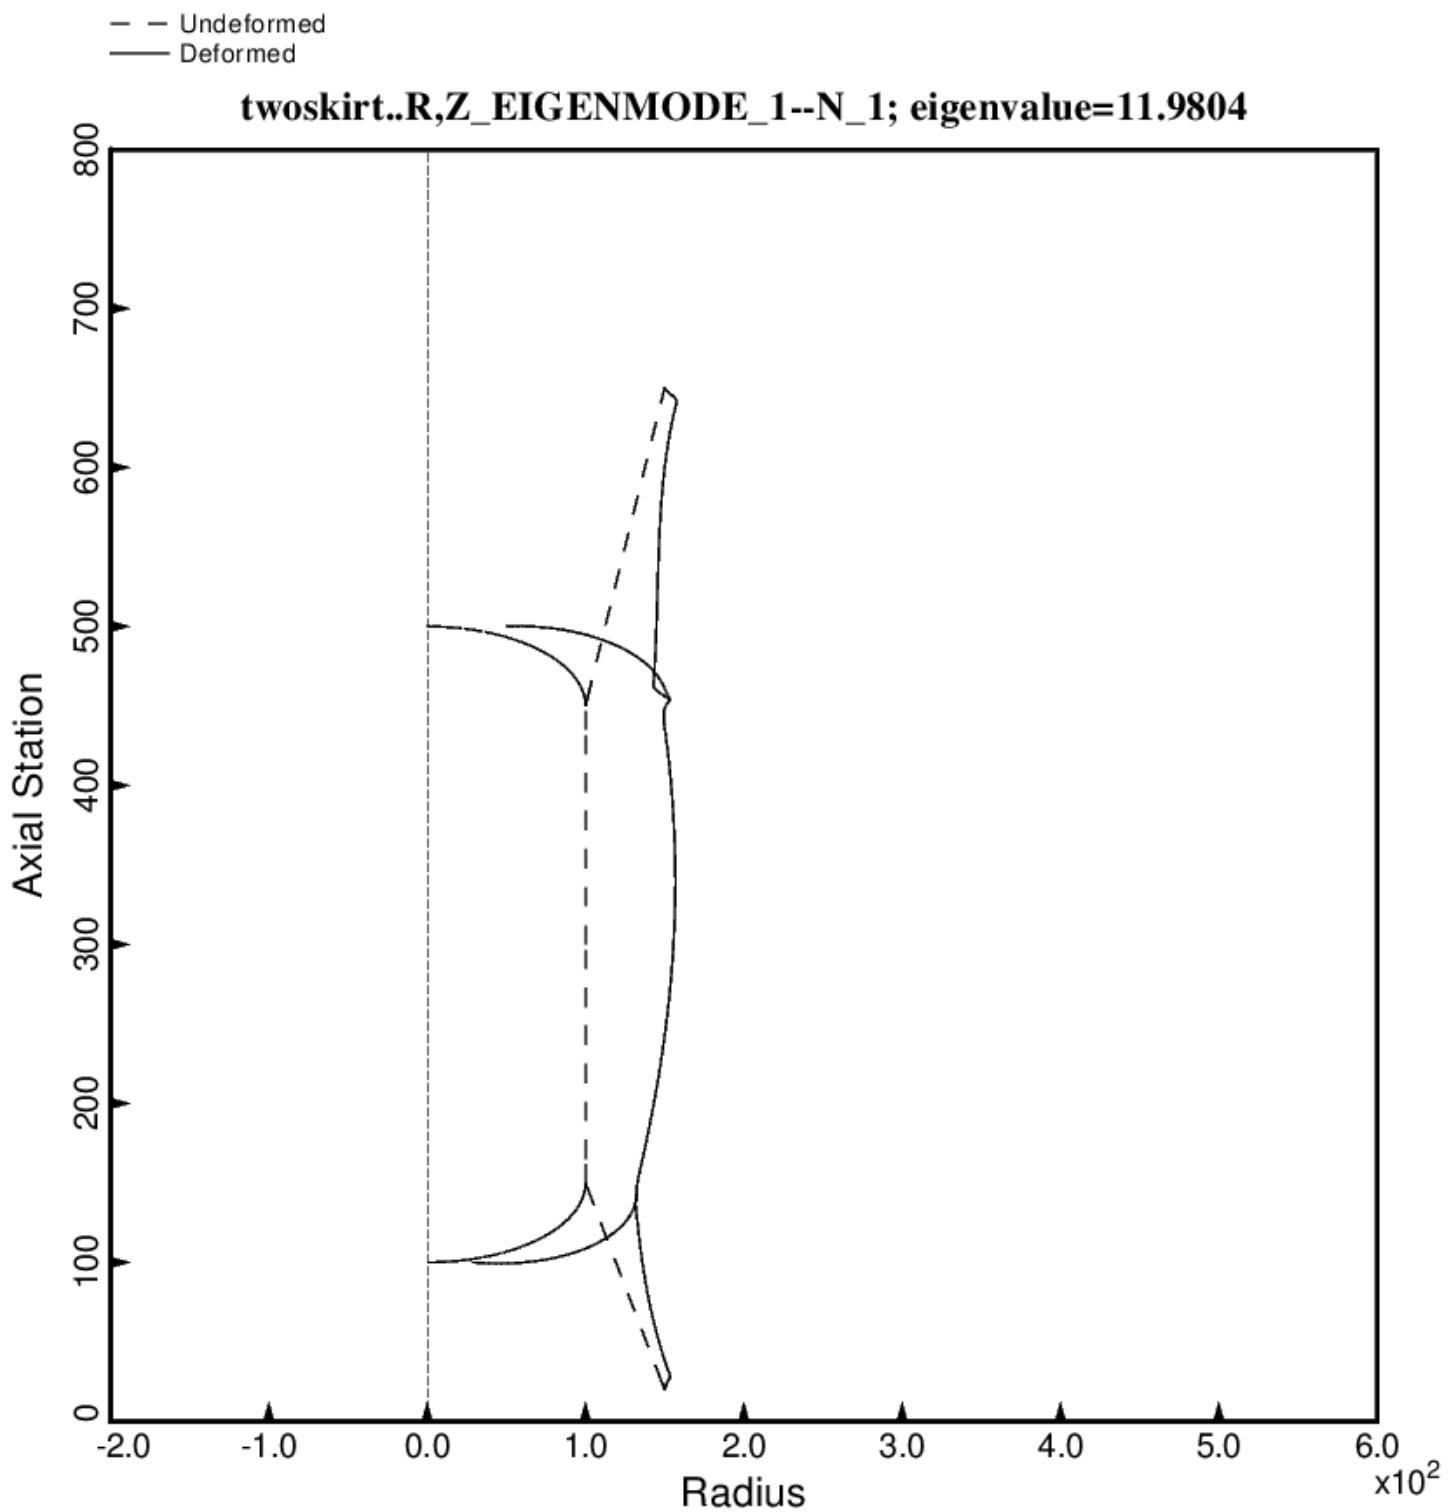

Fig. 25 (new) Lateral-pitching vibration mode No. 1 for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

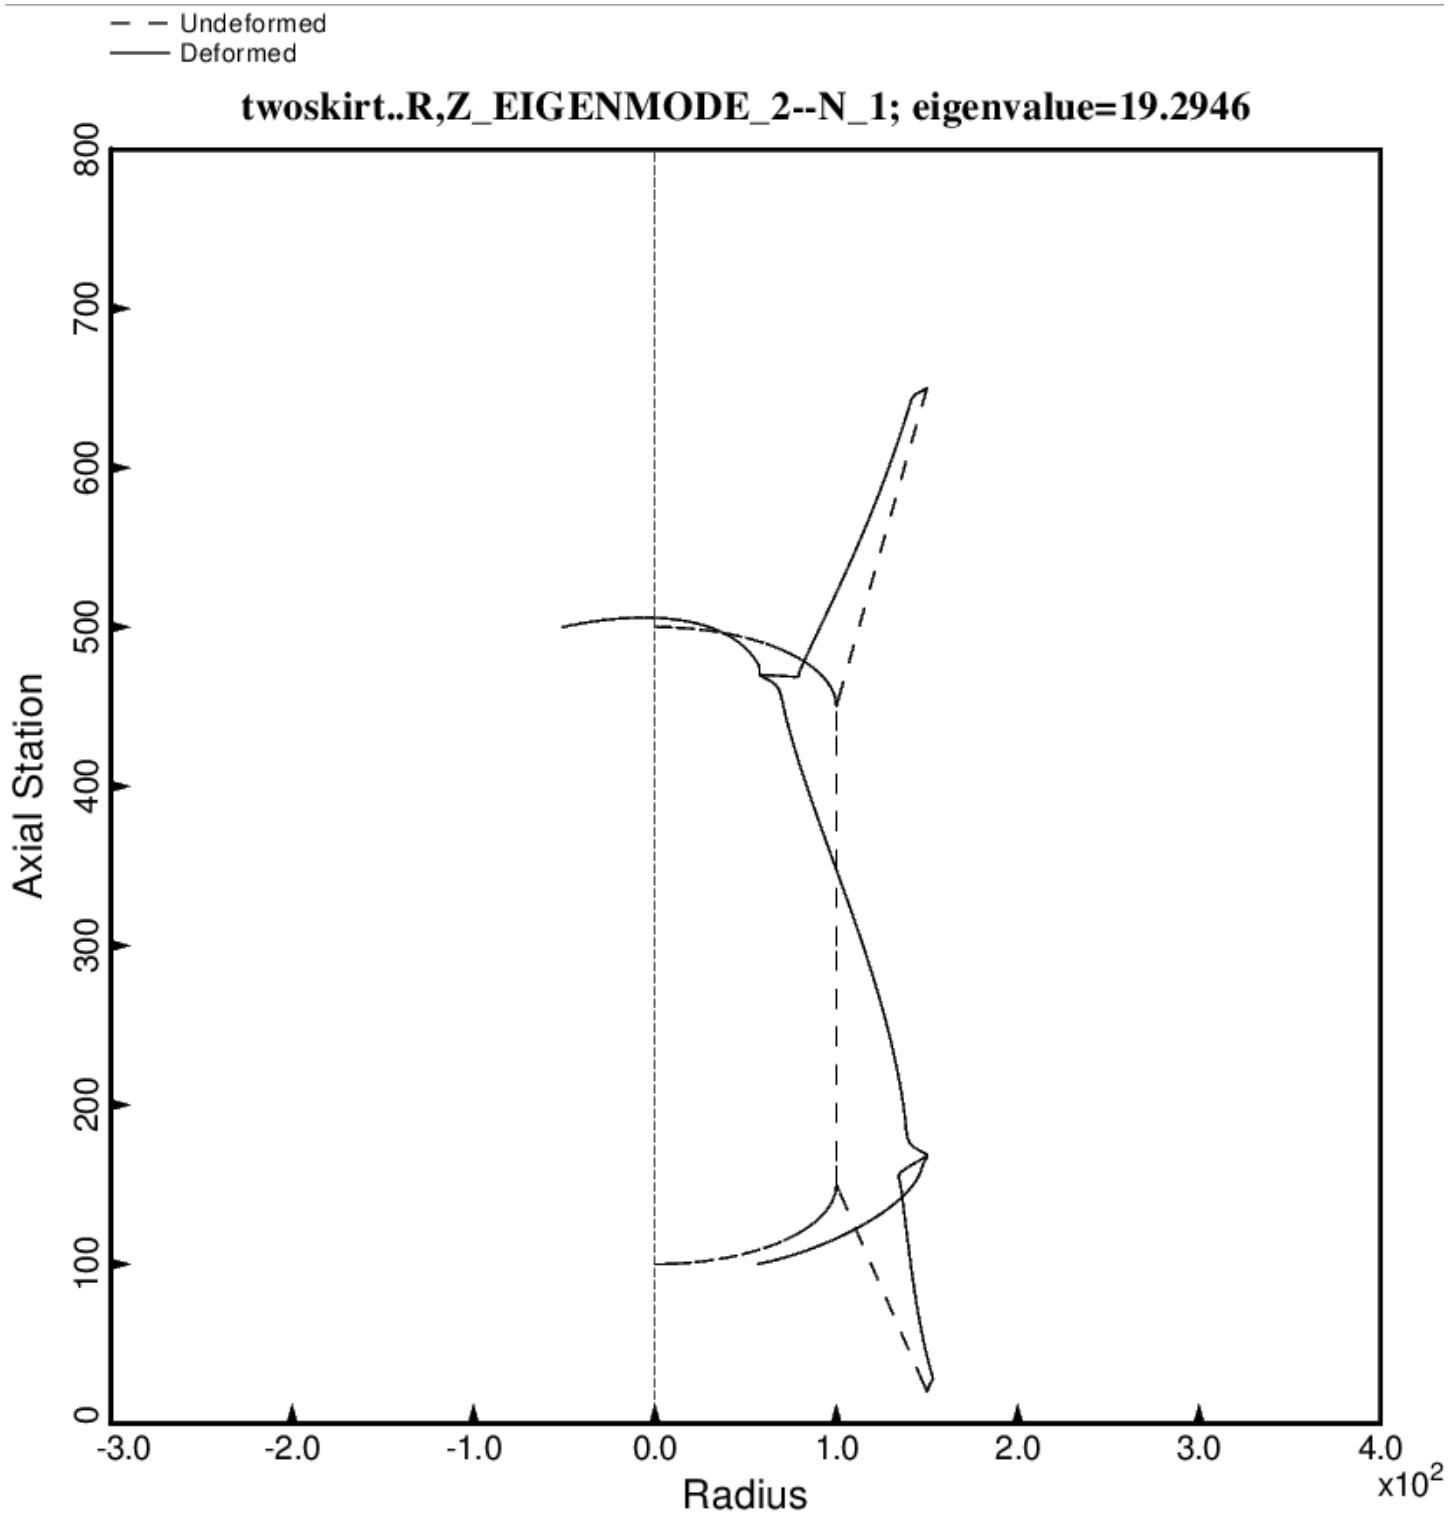

Fig. 26 (new) Lateral-pitching vibration mode No. 2 for the optimized tank/skirt system determined with use of the “regular” or “permanent” versions of bosdec (bosdec.tank2) and addbosor4 (addbosor4.regular).

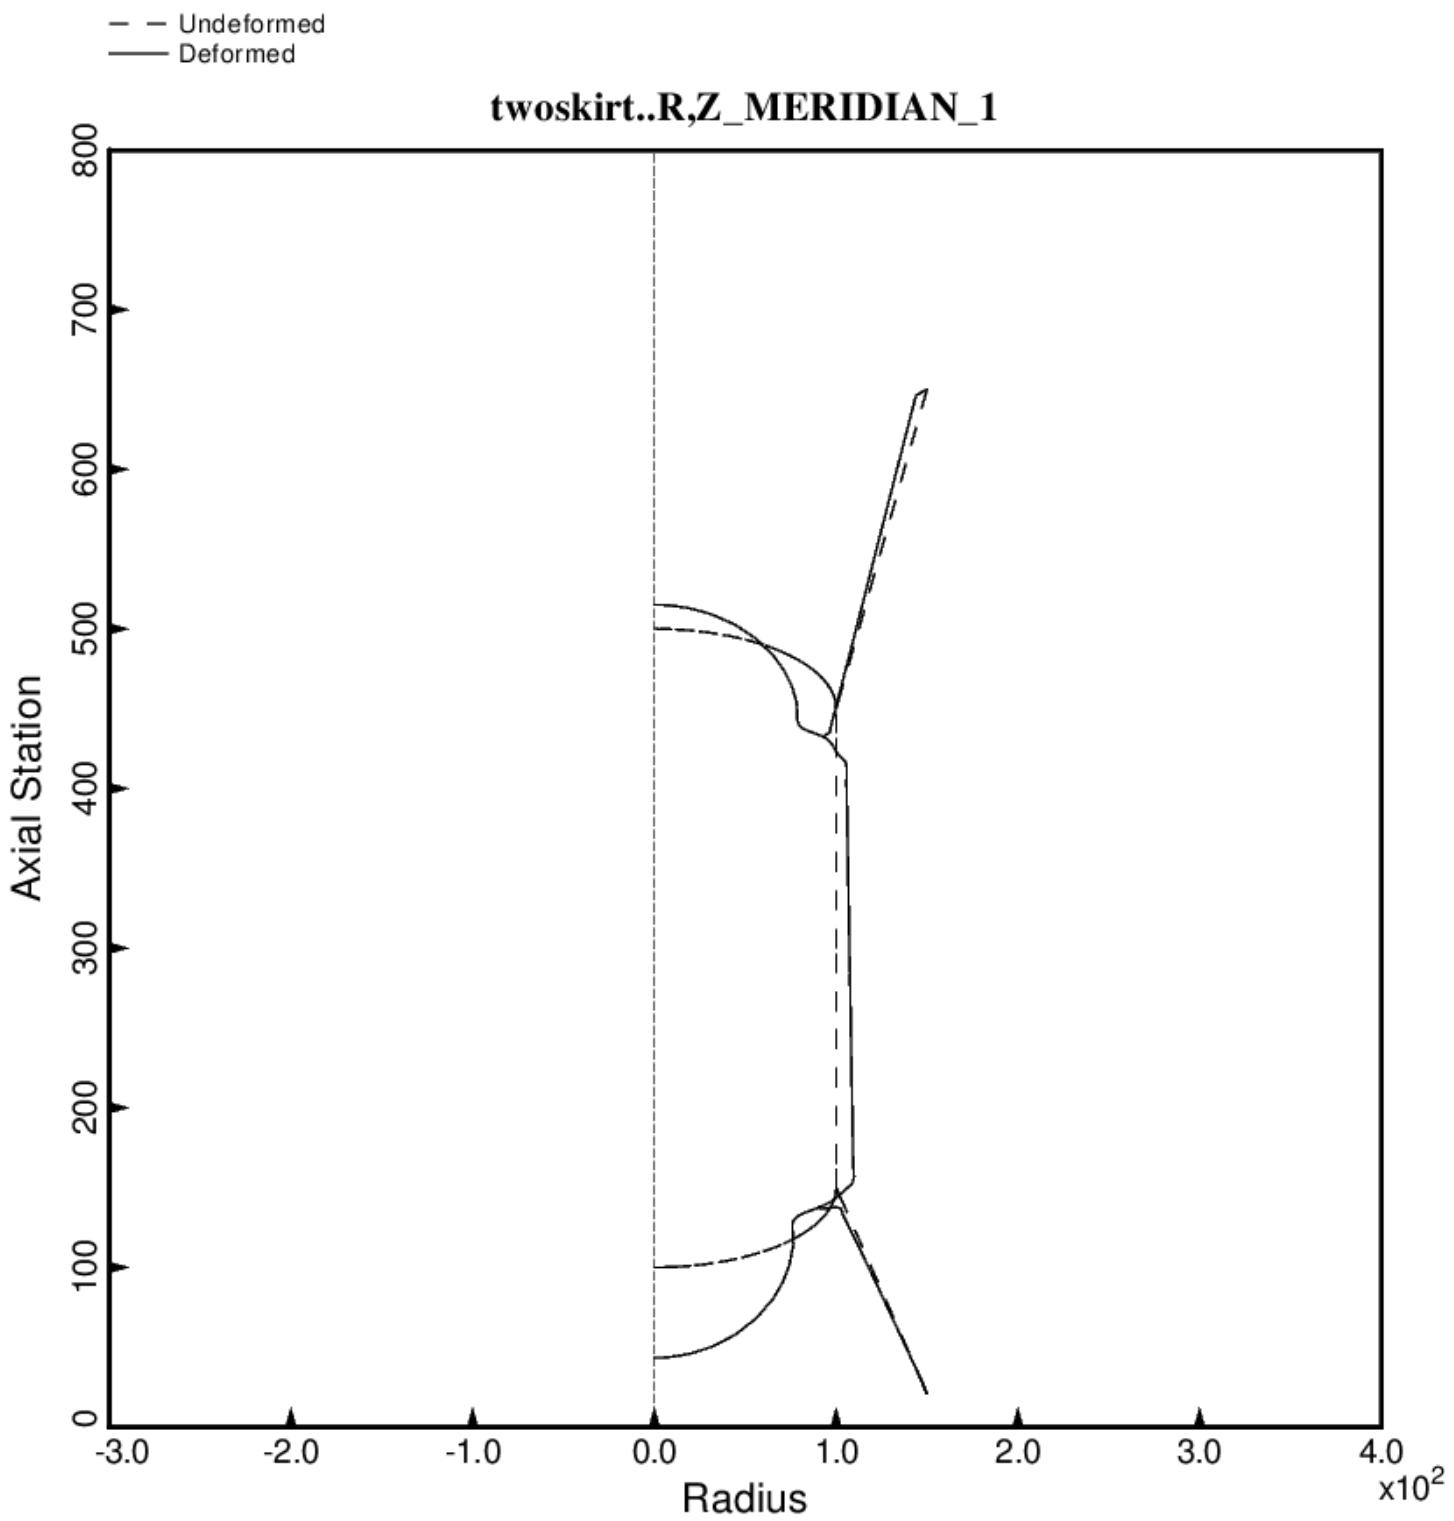

Fig. 27 (new) Axisymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The g-loading is AXIAL.

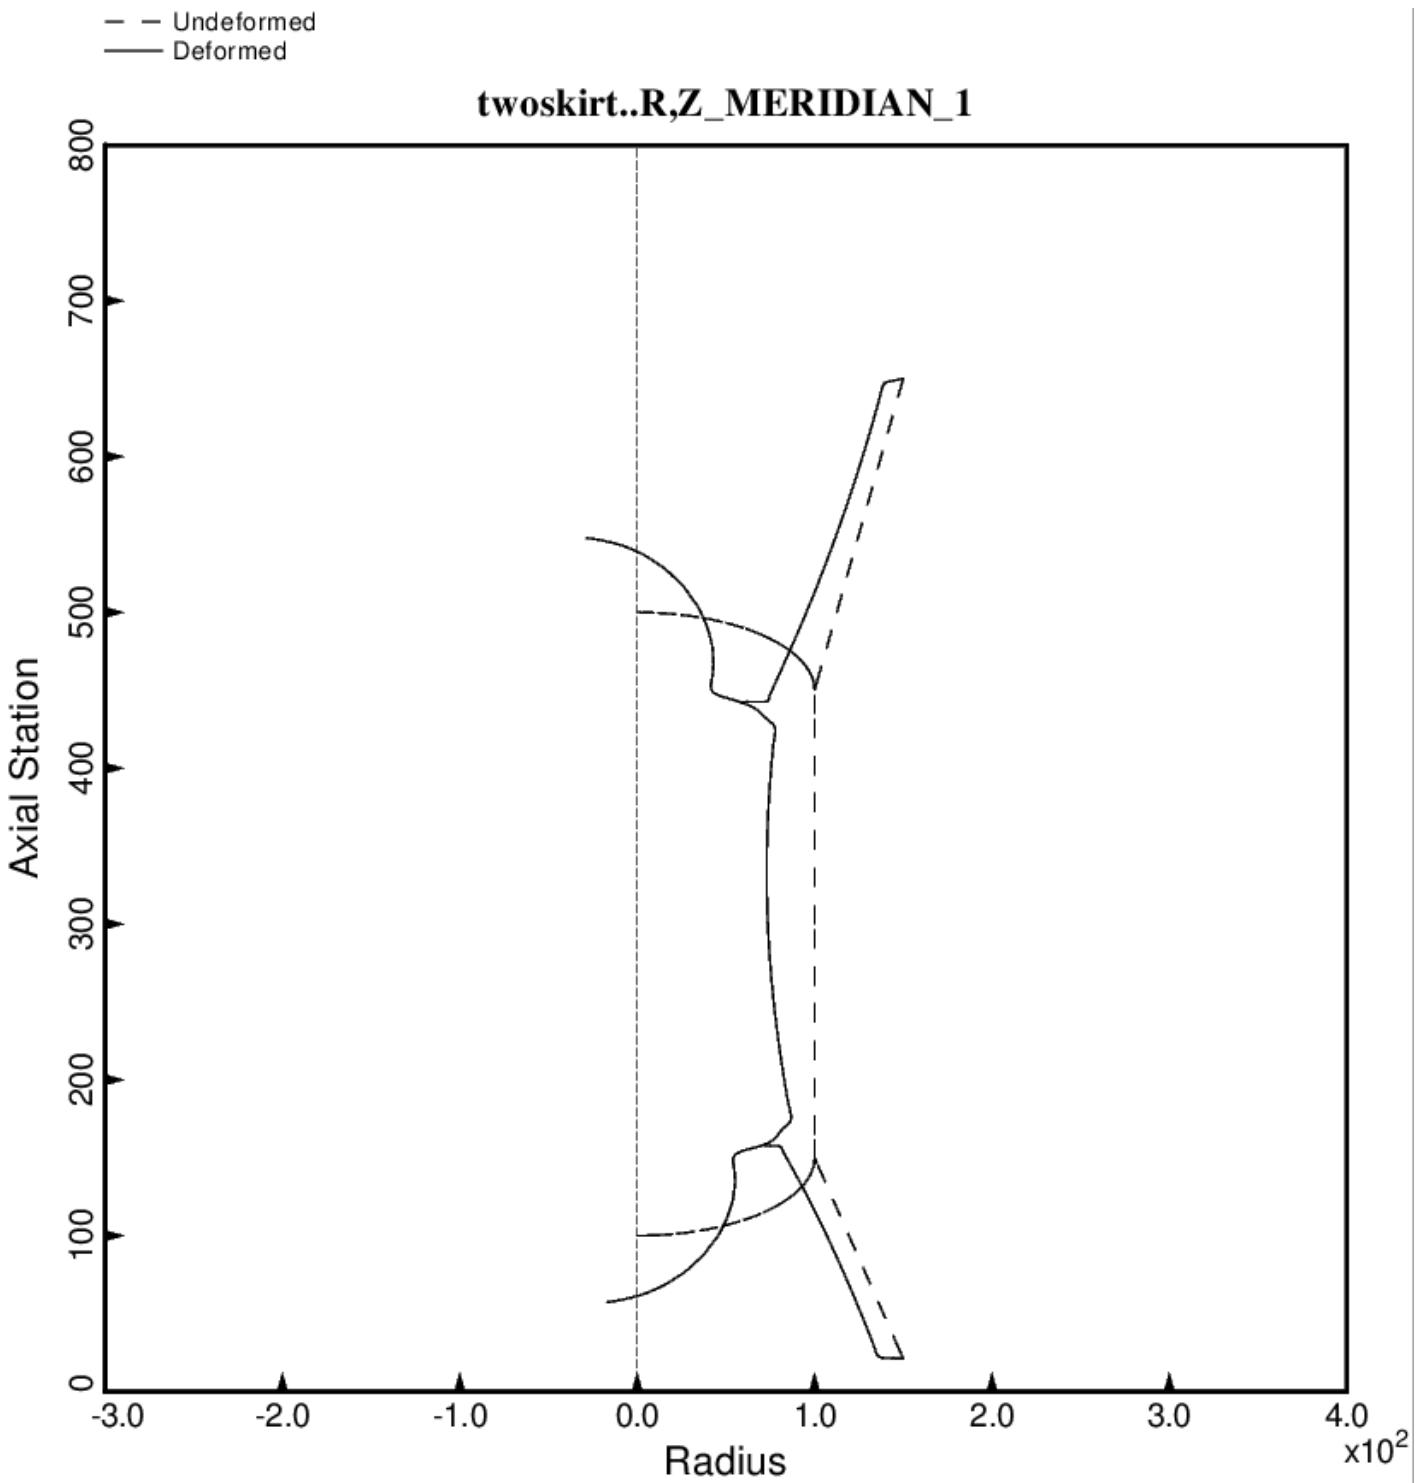

Fig. 28 (new) Nonsymmetric prebuckling deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The g-loading is LATERAL.

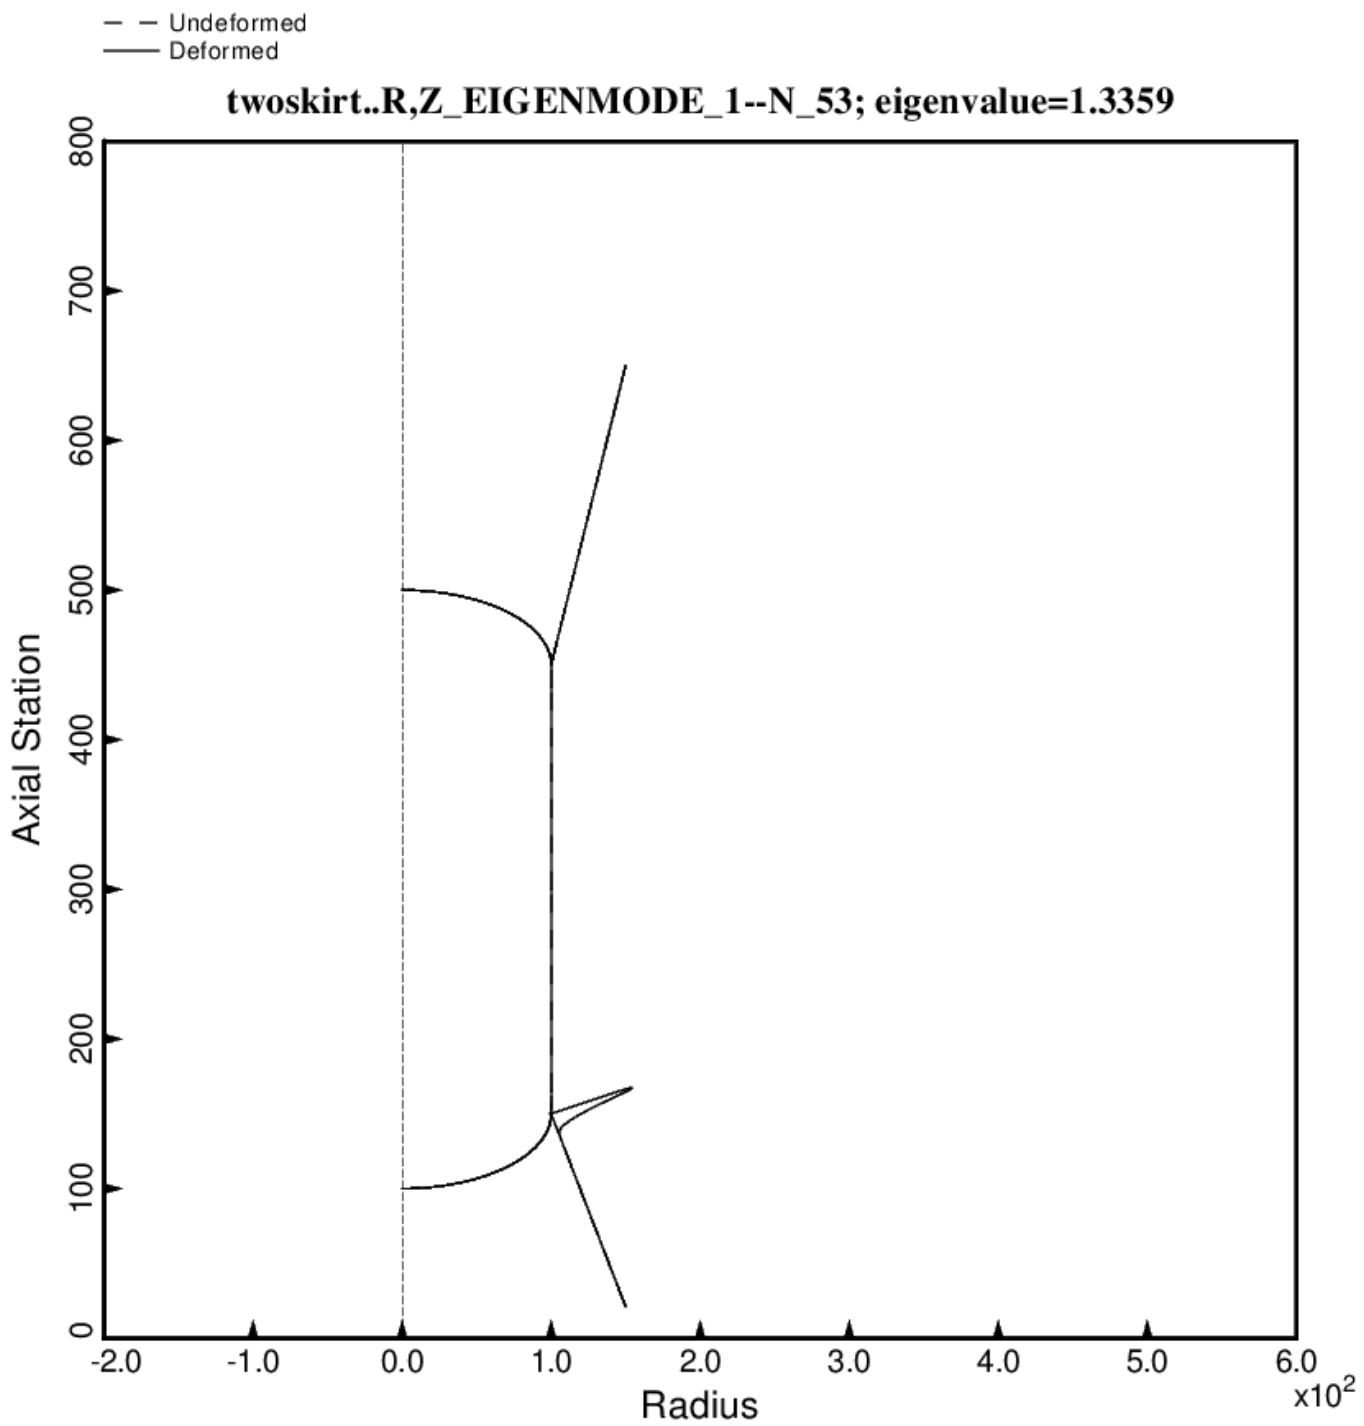

Fig. 29 (new) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g AXIAL acceleration. For  $n = 53$  circumferential waves the lowest buckling load factor corresponds to short-axial-wavelength buckling of the forward part of the aft skirt.

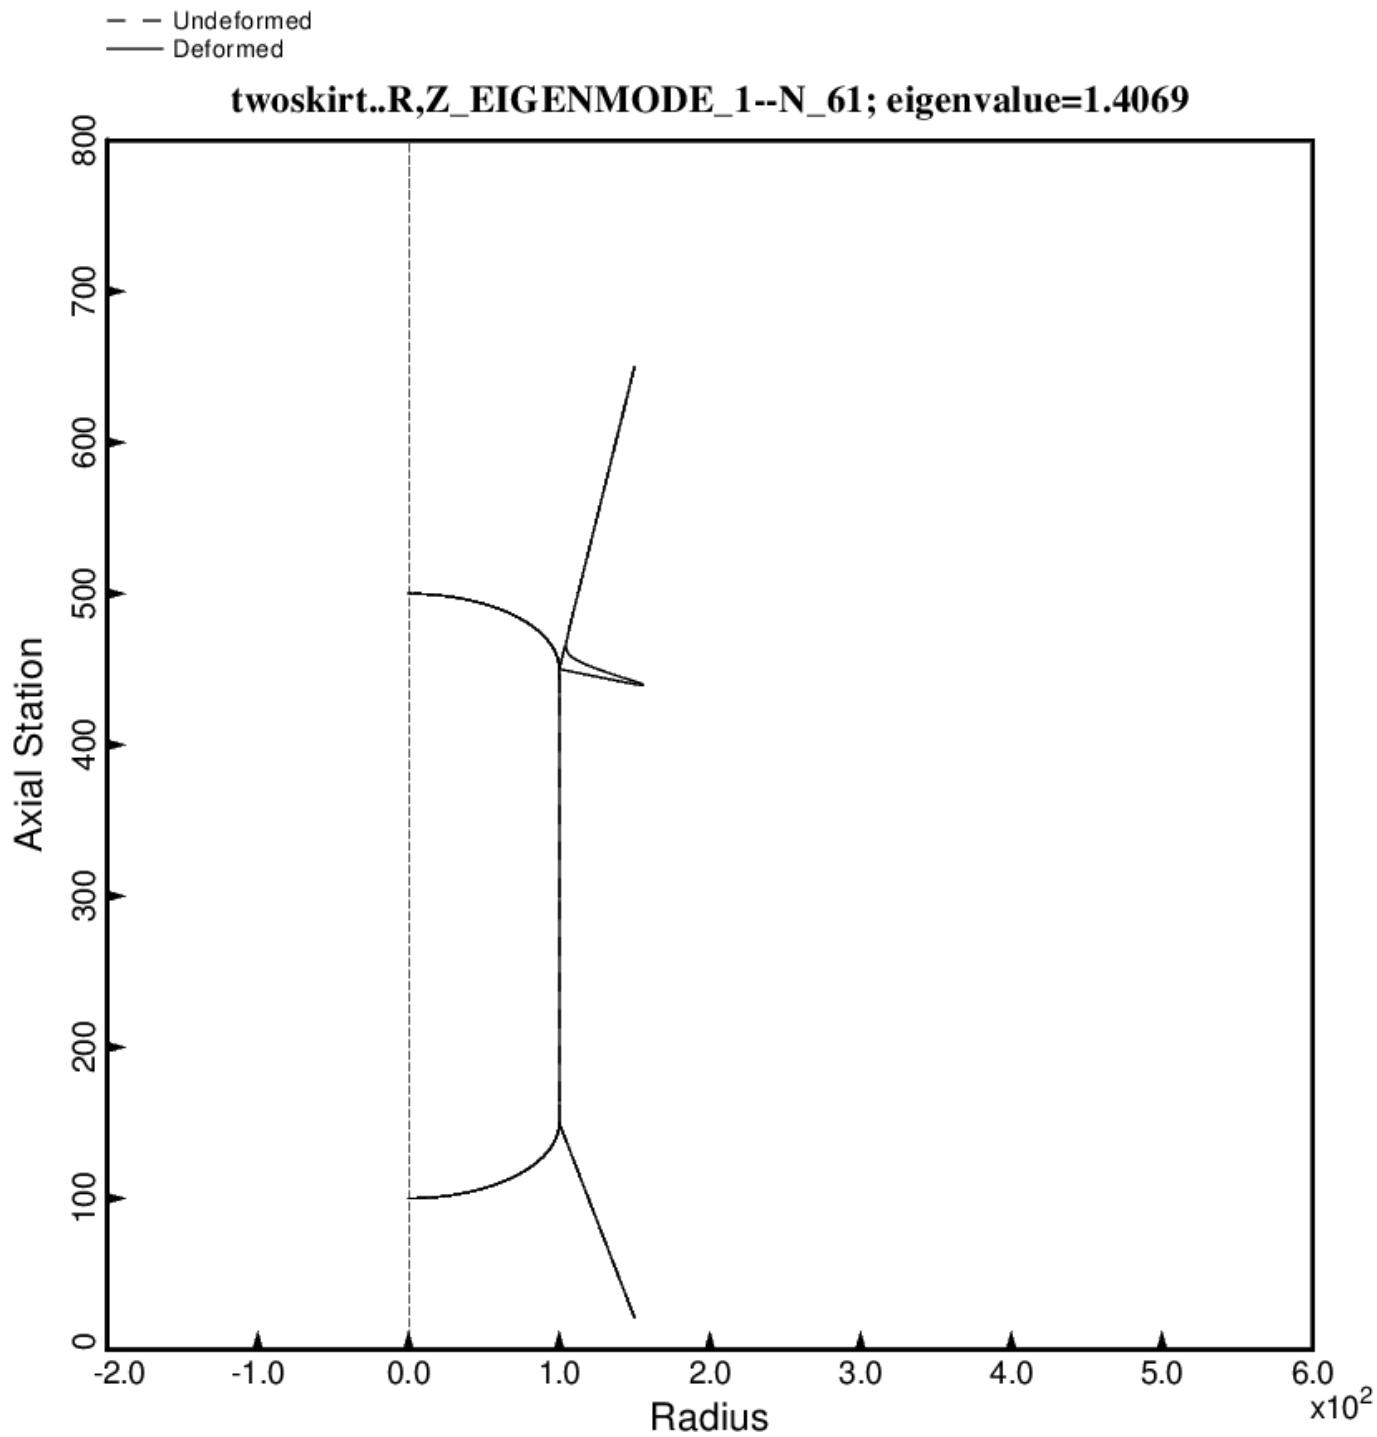

Fig. 30 (new) Nonsymmetric buckling modal deformations of the optimized tank/skirt system determined with use of the “temporary” versions of bosdec (bosdec.tank2.density.var) and addbosor4 (addbosor4.tank2.density.var). The inertial loading is 10g LATERAL acceleration. For  $n = 61$  circumferential waves the lowest buckling load factor corresponds to short-axial-wavelength buckling of the aft part of the forward skirt.
